WARNING

In the U.S., this conversion kit is to be installed by a licensed professional service technician (or equivalent) or other qualified agency in accordance with the manufacturer’s instructions and all codes and requirements of the authority having jurisdiction. If the information in these instructions is not followed exactly, a fire, an explosion, or production of carbon monoxide may result, causing property damage, personal injury or loss of life. The qualified agency is responsible for the proper installation of the kit. The installation is not proper and complete until the operation of the converted furnace is checked as specified in the furnace manufacturer’s instructions supplied with the kit.

Shipping & Packing List

Package 1 of 1 contains the following:
12 - Main burner orifices (0.037)
1 - Gas valve
1 - Gas converter sticker
1 - Nameplate conversion sticker

Application

Units installed in applications of 7501-10,000 ft require installation of a replacement gas valve and gas orifices. Some units may require a pressure switch change, which is ordered separately. See unit installation instructions.

Installation

CAUTION

As with any mechanical equipment, personal injury can result from contact with sharp sheet metal edges. Be careful when you handle this equipment.

1 - Set the thermostat to the lowest setting. Shut off the gas supply to the furnace, then turn off the electrical power at the unit disconnect switch.
2 - Remove the access panel. Move the automatic gas valve switch to OFF. See figure 3.
3 - Disconnect the gas supply from the gas valve. Disconnect the wiring harness at the gas valve.

DANGER

Danger of explosion.
There are circumstances in which odorant used with LP/propane gas can lose its scent. In case of a leak, LP/propane gas will settle close to the floor and may be difficult to smell. An LP/propane leak detector should be installed in all LP applications.

4 - Remove the screw that secures the burner box front cover and remove front cover. See figure 1.
5 - Remove the four manifold securing screws. Remove the manifold/gas valve assembly. Figure 1 shows burner manifold assembly.
6 - Replace the main burner orifices with the provided orifices. Torque to approximately 35 in-lbs.

IMPORTANT

DO NOT use pipe dope or any pipe sealant on gas orifice threads.
7 - The following steps apply to SL280UH(X) NOX units.
a - Remove the screw which secures each of the NOX inserts to the clamshell. **Remove the NOx insert and reinstall the screw.** See figure 2.

8 - Clean the gas manifold threads. Skip the outer three threads, then apply sealant (pipe dope) to a minimum five threads.

9 - Install the provided gas valve. Torque to approximately 350 in-lbs and then hand tighten one turn to proper position.

10 - Reinstall the manifold/valve assembly and the burner box cover. Reconnect wiring harness to the gas valve.

11 - Reconnect the gas supply line to the gas valve and turn on gas supply to unit.

12 - On the nameplate conversion sticker, mark the appropriate box that corresponds to the unit model number. Affix the sticker next to unit nameplate.

13 - Complete the information required on the converter sticker: date, name, and address. Affix sticker to the exterior of the unit in a visible area.

14 - Follow the steps given in the start-up and adjustment section.

---

**IMPORTANT**

Carefully check all piping connections at the valve for gas leaks. **DO NOT** use matches, candles, open flames or other means of ignition to check for gas leaks. Use a soap solution or other preferred means.

**CAUTION**

Some soaps used for leak detection are corrosive to certain metals. Carefully rinse piping thoroughly after leak test has been completed. Do not use matches, candles, flame or other sources of ignition to check for gas leaks.

**Start-Up & Adjustment**

**CAUTION**

Gas valve conversion kit MUST be installed BEFORE the unit is fired using LP/propane gas. **Unit damage WILL OCCUR** if the unit is fired using LP/propane gas with the original natural gas orifices.

**BEFORE PLACING THE UNIT INTO OPERATION**

Smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

Use only your hand to move the gas control switch. Never use tools. If the switch will not move by hand, do not try to repair it. Force or attempted repair may result in a fire or explosion.

**A - Placing the Unit into Operation**

**IMPORTANT**

Follow the lighting instructions provided on the unit. If lighting instructions are not available, refer to the following section.

Units are equipped with an integrated ignition system. The integrated ignition control automatically lights the burners each time the thermostat calls for heat.

1 - **STOP!** Read the safety information at the beginning of this section.

2 - Set the thermostat to its lowest setting.

3 - Turn off all electrical power to the furnace.

4 - Do **not** try to light the burners by hand.

5 - Remove the unit access panel.

6 - Move the switch on the gas valve to **OFF**. Do not force the switch. See figure 3.
7 - Wait five (5) minutes for any gas to clear out. If you then smell gas, STOP! Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions. If you do not smell gas, go to the next step.

8 - Move the switch on the gas valve to ON.

9 - Replace the unit access panel.

10 - Turn on all electrical power to the unit.

11 - Set the thermostat to desired setting.

12 - If the furnace will not operate, see section E- “Turning Gas Off to the Unit” and call the gas supplier.

**C - Gas Flow (Approximate)**

Furnace should operate at least 5 minutes before checking gas flow. Determine time in seconds for **two** revolutions of gas through the meter. (Two revolutions assures a more accurate time.) **Divide by two** and compare to time in table 1 below. If manifold pressure matches table 2 and rate is incorrect, check gas orifices for proper size and restriction. Remove temporary gas meter if installed.

*The carbon monoxide reading should not exceed 50 ppm.*

**D - Proper Combustion**

Furnace should operate minimum 15 minutes with correct manifold pressure and gas flow rate before checking combustion. Take combustion sample beyond the flue outlet. See table 3.

*NOTE - Shut unit off and remove manometer as soon as supply line pressure, manifold pressure and combustion sample have been obtained. Take care to replace pressure tap plug.*

**E - Turning Off Gas To the Unit**

1 - Set the thermostat to its lowest setting.

2 - Turn off all the electrical power to the unit.

3 - Remove the access panel.

4 - Move the switch on the gas valve to OFF. Do not force the switch.
