Shipping and Packing List

Kit (10C16) consists of the following:

<table>
<thead>
<tr>
<th>Quantity</th>
<th>Part</th>
<th>Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>iHarmony Damper Control Module</td>
<td>(Wall fasteners are field-provided)</td>
</tr>
<tr>
<td>1</td>
<td>Discharge Air Temperature Sensor (88K3801)</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Warranty (W-031-L2-02)</td>
<td></td>
</tr>
</tbody>
</table>

The damper control module is compatible with the following Lennox equipment:

- Lennox communicating variable speed or variable capacity (modulating) indoor and two-stage or variable capacity (modulating) outdoor units.
- Lennox communicating variable speed indoor unit and communicating or non-communicating (conventional) single-stage outdoor unit (two zones maximum supported).
- Lennox communicating variable speed indoor unit and communicating or non-communicating (conventional) two-stage outdoor unit (four zones maximum supported).

The following items are also required for the zoning system to operate:

<table>
<thead>
<tr>
<th>Part</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iComfort S30 Ultra Smart Thermostat (12U67)</td>
<td>Thermostat Only Power Consumption: 24VAC, 2.96 VA</td>
</tr>
<tr>
<td>17A30 iHarmony Zone Sensor are required for zones 2 through 4.</td>
<td>Power Consumption: 17A30: +10VDC TO +14VDC (12VDC nominal). Maximum Current Consumption: Less than 133mA</td>
</tr>
<tr>
<td>Zone damper transformer, see “Table 1. Zone Damper Transformer Selection Chart” for correct size.</td>
<td></td>
</tr>
<tr>
<td>Optional freezestat, see “Table 7. Available Freezestats” on page 8 for available freezestats based on tubing sizes.</td>
<td></td>
</tr>
<tr>
<td>Heat Pump Applications Only: HFC-410A high pressure switch (550PSI) (27W13) and valve depressor tee (87071) are required.</td>
<td>27W13 Power Consumption: 5VDC sensor supply and 0.5-4.5VDC sensor output</td>
</tr>
<tr>
<td>Zone dampers — recommended zone dampers are spring-open and power-close but you may also use power-open and spring-close, or power-open and power-close. Modulating dampers are not supported. For extended dampers, recommend using relay 56L68.</td>
<td>Power Consumption: 56L68: 24VAC, 240mA Damper: Manufacture dependent.</td>
</tr>
</tbody>
</table>
Zone Damper Transformer

The zone dampers are powered by a field-provided 24VAC transformer. Zone dampers typically require 6 to 12VA each depending on zone damper manufacturer being used. The zone damper transformer must have an adequate VA rating to serve all components (see recommendations in following table).

The damper control module (nominal 24VAC, 2AMP with 4 dampers closed) and three in-zone thermostats require a total of 6VA to operate.

<table>

IMPORTANT
Use 18AWG unshielded thermostat cable (field-provided) for power terminals (R and C). Highly recommend using 18 - 22AWG shielded thermostat cable for communications terminals (I+ and I-) which will help eliminate any noise interference.

(All values are @ 25VAC, 60Hz. 25 Degrees Celsius [77°F] unless noted)
Discharge Air Temperature Sensor (DATS)

Installation of discharge air temperature sensor (DATS) must comply with the following requirements:

- Installed downstream of the heat exchanger or electric heat elements.
- It must be placed in free airflow, where other accessories (such as humidifiers, UV lights, etc.) will not interfere with its accuracy.
- Wiring distance between the integrated furnace and air handler controls or damper control module and the discharge air sensor must not exceed maximum distance as referenced in “Table 4. Terminals and Wiring Recommendations” on page 4.
- DATS is highly recommended for all systems that include a variable capacity outdoor unit in order to provide more precise dehumidification operation.

The included discharge air temperature sensor (88K38) monitors the supply air. "Figure 2. Discharge Air Temperature Sensor Installation (Typical Up-Flow Furnace)" shows the discharge air temperature sensor. This electronic sensor’s probe is inserted into the discharge air plenum to gather air temperature data for the zone control module.

- The DATS should be located at least 19 inches above the air handler unit and 10 inches above the cooling coil with a furnace.
- Locate the tip of the sensor 1/2 the depth of the plenum, and centered over the discharge airflow, side-to-side in the discharge plenum.
- Fasten the sensor bracket to the plenum with two self-tapping sheet metal screws.
- Connect wires to DATS on damper control module, NOT on the Lennox communicating indoor unit control.

**NOTE:** FOR UNITS WITH HUMIDITROL—Discharge air sensor temperature (DATS) MUST be located on the output side of the EDA (if used; see Humiditrol Zoning Accessory Installation 507944-xx).

**IMPORTANT**

If the DAT sensor has failed, shorted or not installed, iHarmony will only operate in central mode. This mode is also indicated by the DCM central mode LED being on. There is no notification by the thermostat for this issue.

**Outdoor Air Temperature Sensor (OATS)**

The optional outdoor air (temperature) sensor (OATS) (X2658) wiring distance to the iComfort S30 should not exceed 150 feet (45 meters) when wired as specified in “Table 4. Terminals and Wiring Recommendations” on page 4.

Installation of OATS must comply with the following requirements:

- Sensor wiring must be run to avoid touching or being close to high voltage wiring and light ballast.
- Choose a protected outdoor location away from direct sunlight or other heat sources (usually on the north side of the building).
- Ensure that water will neither collect on, nor wash over the sensor.
- Do not locate the sensor near driveways or similar heat-absorbing masses which may reflect stored heat energy onto the sensor and send inaccurate information to the thermostat.
- Locate the sensor away from attic and soffit vents, or furnace venting pipes.
- Do not locate the sensor directly above an air conditioner or heat pump.

### Transformer Phasing

The indoor unit and zone damper transformers must be in-phase since both are connected to the damper control module. Follow the instructions below for phasing both transformers.

1. Connect the damper control module indoor R and C to the indoor unit R and C.
2. Connect the external 24VAC transformer to the damper control module DMPR XFMR C terminal only. Check voltage from indoor R to External XFMR wire R. If voltage is not phased then switch before connecting wires. This will keep damaging voltage off of the control module.
   - In-phase voltage will be the difference of both XFMR voltages approximately less than 5VAC.
   - Out-of-phase voltage will be the sum of both XFMR voltages approximately greater than 50VAC.
3. Verify voltage between the damper control module indoor R and DMPR XFMR R terminals after wires are connected.

### Damper Wiring

See table 1 to determine the minimum damper transformer VA requirements based on the number of zones being installed. If extended zone dampers are used then see figure 2 for damper, transformer and zone relay wiring requirements.
Refer to the iHarmony® Zoning System Product Specification for ordering dampers and other various components.

Once the damper control module has been installed and the system energized, the damper control module will automatically populate the thermostat commissioning screens. All zone CFM settings will be selected from commissioning screens for continuous blower and both heating / cooling blower operations. Testing CFMs for each or all zones may also be performed.

1. The extended damper transformer will only supply power to extended dampers and relay contacts.

2. The system transformer powers the relay coils (0.4VA each).

3. Combined load of damper transformer (see “Table 1. Zone Damper Transformer Selection Chart” on page 3) and add 0.4VA per zone relay to determine the minimum damper transformer VA requirements. Total VA requirements should not exceed 60VA.

**NOTE:** Connections illustrated here are for the Lennox recommended spring-open/power-close dampers. The connections would be different for other dampers.

**NOTE:** For extended dampers, use Lennox Part catalog number 56L68 for zone relays 1 through 4. (Pulse Control Relay, SPDT, 1 N.O. and 1 N.C., 24VAC)

### Pressure Switch

(Required for heat pump applications.)

#### 🚨 IMPORTANT

**Heat Pump Systems Only:** Do not use jumper for pressure switch terminals at the damper control module. System will not function properly without pressure switch installed.

**NOTE:** Outdoor unit (heat pump) will not operate if pressure switch is not installed. The location of the pressure switch may be installed at the indoor coil using the expansion valve equalizer line connection as an alternate pressure switch installation location. When the pressure switch is installed at the indoor coil expansion valve equalizer connection, a with flare tee will be required and the TXV equalizer line must be connected to the connection on the tee without a Schrader valve core.

#### 🚨 CAUTION

High Pressure Switch must be installed on open side of tee first to prevent refrigerant loss.

Pressure switch 27W13 should be installed at indoor coil.

---

**Figure 5. Tee and Vapor Line High Pressure Switch**

A field-provided HFC-410A high pressure switch (catalog number 27W13) is required for applications with a Lennox heat pump. This switch protects the system in the event a high pressure condition occurs in the outdoor unit during heating mode.

The switch operates in tandem with the factory installed high pressure switch, but connects to the iHarmony control instead. The switch is an auto-reset type that opens at 550 psig and closes at 425 psig.

**NOTE:** If a pressure switch is factory installed in the outdoor unit, do not remove the switch or switch wires.

The damper control module pressure switch may also be fastened directly to the vapor valve service port using a field-provided tee adapter. This line becomes the discharge line in heat pump heating mode. Recommend using pressure switch valve tee adapter (catalog number 87071).

Other conditions:
- Pressure switch status is used only for the heat pump heating and does not have any affect on non-zone demands.
- Heat pump will stop after the pressure switch status remains open for 60 seconds.
Staged Heat Pump Units

Should the pressure switch open during heat pump heating second stage operation:

- Lennox communicating thermostat will downstage the heat pump from second-stage to first-stage heating operation in order to bring the system pressure down to a point where the switch closes again.
- If the unit is already running in first-stage when the pressure switch opens, the unit will shut off.
- If the switch closes within 60 seconds, then the Lennox communicating series thermostat may send a demand for second-stage heat pump if needed.
- If the switch does not close within 60 seconds, the Lennox communicating thermostat stops heat pump heating and satisfies the heating demand with backup heat (backup heat is either electric or gas) regardless of the ambient temperature being above the high balance point.

The heat pump is used again on the next call provided the pressure switch has closed; otherwise backup heat is used on subsequent heating calls until the pressure switch closes.

Variable Capacity Heat Pump Units (XP20 and XP25)

If the pressure switch opens during heat pump heating operation:

- Lennox communicating series thermostat will respond by sending a HP heat demand with the demanded rate equal to the current rate 25%. (i.e. the switch opens during a 90% heating demand,
- Lennox communicating thermostat then sends a demand for 9025 = 65%) If new calculated rate is below the minimum for the unit, minimum demand is sent.
- If the switch closes within 60 seconds, then the Lennox communicating series thermostat may change the demand for the heat pump as determined by the DATS.
- If the switch does not close within 60 seconds, the Lennox communicating series thermostat stops heat pump heating and satisfies the heating demand with backup heat (backup heat is either electric or gas) regardless of the ambient temperature being above the hi balance point.

The heat pump is used again on the next call provided the pressure switch has closed; otherwise backup heat is used on subsequent heating calls until the pressure switch closes.

Freezestat (Optional)

![Figure 6. Typical Freezestat Installation - Indoor Coil](Image)

This optional component is only required if there is a small zone with little airflow which is causing the indoor coil to freeze up. However, normal return air temperature should prevent this from occurring. The addition of the freezestat will provide for added protection.

**NOTE:** The damper control module comes from the factory with an insertion bridge installed on the freezestat terminals (see “Figure 7. Damper Control Jumpers LEDs and Connections” on page 14). Do not remove unless a freezestat is connected. Outdoor unit will not operate if insertion bridge is removed (missing) and no freezestat is installed.

The table following lists available freezestats for use with the damper control module.

<table>
<thead>
<tr>
<th>Catalog Number</th>
<th>Piping Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>93G35</td>
<td>⅜”</td>
<td>Opens at 29°F, and closes at 58°F</td>
</tr>
<tr>
<td>50A93</td>
<td>⅝”</td>
<td>Opens at 36°F, and closes at 58°F</td>
</tr>
</tbody>
</table>

**Suggested Freezestat Installation Method**

The following is the recommended method for installation of the freezestat for
connection to the damper control module.

1. A freezestat, sized per “Table 7. Available Freezestats” and ordered separately, can be installed. Install the freezestat on one of the copper lines between the last hairpins and the suction manifold (see “Figure 6. Typical Freezestat Installation - Indoor Coil”) of the indoor coil.

2. The freezestat senses the line temperature and cycles the compressor off when the line temperature fails below its setpoint. The freezestat will open and close as listed in “Table 7. Available Freezestats”

3. Connect freezestat wires to the freezestat terminals on the damper control module after removing the factory installed bridge (see “Figure 7. Damper Control Jumpers LEDs and Connections” on page 14).

Zoning 401 Setup and Configuration

Establishing the Baseline

- Verify voltages and recommended wiring procedures.
- All device wiring must be connected at the indoor unit control terminals.
- Install recommended wire as per “Table 4. Terminals and Wiring Recommendations” on page 4.

Important

Multi-Conductor Applications

Communicating systems require four thermostat wires between the damper control module and indoor unit. When a thermostat cable with more than four wires must be used, the extra wires must be properly connected to avoid electrical noise. The wires must not be left disconnected.

Use wire nuts to bundle the unused wires at each end of the cable. A single wire should then be connected to the indoor unit end of the wire bundle and attached to the “C” terminals.

Wire nut unused wires of each bundle at device location and do not connect to any common.

- Install DATS as per recommendation “Figure 2. Discharge Air Temperature Sensor Installation (Typical Up-Flow Furnace)” on page 5.
- Phase transformers as per recommendation “Figure 3. Confirming Correct Transformer Phasing” on page 6.
- Verify iComfort voltages are consistent with the service and application note ACC-17-01 standards.

Mapping the Design

Using a specific setup technique to achieve a specific design operation.

- From the thermostat’s home screen select settings > advanced settings > dealer control center > equipment and select furnace or Air Handler. Then verify or adjust the following parameters as noted:

| Table 8. Zoning Target Supply Air Temp Gas/Electric Heating Pocket Formula and Recommended Airflow CFMs |
| Select temperature setting using pocket formula and recommended Max Airflow CFM values to achieve maximum capacity in overshoot operating range. |

| Modulating furnace example: 64000 / 1025 / 1.08 = 57.8 + 70(=RA) = 127.8 - 10°(overshoot) = 117.8° |

Round up to nearest 5°= set target air temp to 120°

| Staged furnace example: 64000 / 1025 / 1.08 = 57.8 + 70(=RA) = 127.8 - 20°(overshoot) = 107.8° |

Round up to nearest 5°= set target air temp to 110°

- Verify High Cooling airflow to default ((1 and 2 stage units only)).
- Set Airflow Profile - Cooling to option “D” for specific use in cooling test mode (1 and 2 stage units only).
- Verify High HP Heating Airflow is set to default (1 and 2 stage units only)
- For modulating unit airflows, see the modulating outdoor unit tab.
- Verify Continuous Indoor Blower Airflow is set to default.
- Set the Heating Indoor blower off delay to 180 seconds.
- Set high heating airflow to recommended model number value listed in “Zoning CFM Tables” on page 17 to insure mid-range temperature rise operation.
- From the selection screen now select smart hub and verify the following:
  - Verify gas heat control for modulating furnace is defaulted to Load Tracking Variable Capacity.
  - Verify Zoning Gas Heating DAT Cooldown Target is set to 90°F.
  - Verify Zoning Anticipated Discharge Air Temperature Adjustment is set to 0 seconds.
  - Verify Zoning Target Air Supply Air Temp Cooling is set to 45°F (+7° operation range is 45° - 52°F).
  - Zoning Supply Air Limit for Cooling - Recommend setting to 10°F below Zoning Target Supply Air Temp Cooling.
    Example: If Zoning Target Supply Air Temp is left on default (45°F), set Supply Air Limit for Cooling to 35°F. (45 - 10 = 35)
  - Verify Zoning Target Supply Air Temp Gas/Electric Heating is set to 100°F (10/20° overshoot range is 100° - 110/120°F).
    - Staged gas and electric units will have 20° overshoot.
    - Modulating gas units will have a 10° overshoot.
How to convert electric heat watts to BTUs/Hr

<table>
<thead>
<tr>
<th>15KW = 15,000 Watts</th>
</tr>
</thead>
<tbody>
<tr>
<td>15,000 Watts X 3.413 = 51,195 BTUs/Hr</td>
</tr>
</tbody>
</table>

» Verify **Zoning Target Air Temp for HP Heating** is 90°F (10° overshoot range is 90°- 100°F).

» Verify **Zoning Supply Air Temp Limit for Cooling** is set to 40°F.

» Adjust **Zoning Supply Air Temp Limit for Gas/Electric Heating** to 160°F. Set high heating limit to minimum of 15° above operating target DAT and round up to the nearest 5° limit option setting. Recommend 160° limit temp to avoid short cycling and DAT cool down mode.

» Verify **HP Heating Lockout Time** is set to 60 min.

• Go to the Verify Airflow Per Zone Screen.

  » From the Equipment list, select **reset** and on the right side of the screen, select **re-configure system**.

  » Verify the **dealer info** is completed on the first screen.

  » Continue to navigate through the various screens until you arrive at the **iHarmony zoning** screen. Verify the names for each zone are correct. Then select **continue**.

  » Select the following for each zone and set the correct CFM for the zone.

    - **Blower Circulation Airflow** per zone: For up to four zones, each zone assigned airflow at least the minimum CFM value per tonnage, for example 250 CFM for 3-ton, 380 for 4-ton or 450 CFM for 5-ton. Adjustment are in 5 CFM increments.

    - **Heating Circulation Airflow** per zone:
      ◊ Enter Recommended CFM Per Zone from “Zoning CFM Tables” on page 17.
      ◊ On staged units, values are mid-range temp rise specific and should only be changed if the maximum of <79% Indoor Blower Power (IDBP) cannot be achieved.
      ◊ Final adjustment will be made after IDBP testing.
      ◊ If lower CFM is needed to maintain proper IDBP the value must remain within the recommended range listed in the blower tables.
      ◊ On modulating units any value between the recommended and max airflow will operate at the same temp rise and can be selected based on the amount of BTU’s each zone requires as per load calculations.
      ◊ The percentage of Max BTU is relative to the percentage of Max CFM.
      ◊ If a lower CFM is needed to maintain proper IDBP the value must not go below the Absolute Min CFM per Zone listed in the blower tables.

    - **Cooling Circulation Airflow** per zone:
      ◊ Enter the recommended CFM per zone for the cooling load per zone maintaining CFMs above the minimum CFM values per zone.
      ◊ Final adjustment will be made after IDBP and target air temperature approach are determined

• Once adjustments have been completed, select **continue**. This will take you to the test mode.

**Sizing the System**

Select manual test then apply.

• Record and verify all blower settings were saved.

• Select **continue** at the bottom of the screen and select **manual tests** and then select **apply**.

• From the **select tests to run** screen, select the option **deselect all**.

• Select **maximum rate for the heating unit being tested**.

  » Verify heating rate 100%.

  » Verify CFM demand matches the high heating airflow setting.

  » Verify IDBP <79%. The indoor blower power is helpful in determining if the zone ductwork has a high static pressure that the blower may not be able to overcome and cause the blower to run in cut back mode.

    - If IDBP is <79 % do not adjust high heating airflow.

    - This value is designed for mid-range temp rise operation vital to maximum heat exchanger life and performance.

  » If IDBP is <79 % scroll down to the second discharge air temperature (S30) reading below the zoning section on the same screen.

  » **Calibrate the DATS**

    - Move DATS probe in or out as required until discharge air sensor value (located in diagnostics) is close to the actual discharge air temperature target, the DAR is based on BTU/CFM/1.08+Return Air Temperature. This is a mapping value generated by the DATS not based on actual stratified plenum temperature.

    - If the DATS value exceeds the overshoot range the furnace will not maintain 100% capacity operation

  » Return to previous screen

  » Select maximum or 2nd stage cooling and start.

    - Verify cooling rate 100%.

    - Verify CFM demand is the value selected. Set the assigned airflow equal-to, or greater-than the maximum airflow (airflow assigned for peak cooling load)
- Verify IDBP <79% and record value.
- Verify DAT has approached cooling target temp setting without exceeding it during 100% cooling rate.
  ◊ If not, return to equipment and lower high cooling airflow CFM to achieve maximum cooling capacity at a lower discharge air temperature.
  ◊ The DAT should be approximately 2° above the setting to allow for air filter loading.
- If any heating or cooling test results in IDBP >79% return to the dealer control center. A higher IDBP >79% is an indication of a high static duct system or loaded filter.
- Select > equipment.
  ◊ Select furnace and lower the high heating airflow CFM according to the amount assumed needed and retest until IDBP value is confirmed <79%.
  ◊ Select the associated outdoor unit and lower the high cooling and/or heat pump heating airflow to match the heating CFM value.
- Equipment maximum capacity is now properly sized to the duct system.
- Return to thermostat’s home screen.

Testing the Zones

Verify proper operation of each or combination of zones.
- **Heating test** per zone.
  » From the thermostat’s home screen, navigate to the smallest zone.
  » Select **modes and schedules** and select **heat only**.
  » Initiate a 5° heating call and wait for “heating” status on the display.
  » Then navigate to **settings** > **advanced settings** > **dealer control center** > **diagnostics** > **select all** > **start diagnostics**.
- Select **Furnace**
  ◊ Verify heating rate = 70% typical starting rate
  ◊ For modulating furnace:
    » Heating rate will change to the approximate percentage value of CFM per zone divided by max airflow setting.
    » If discharge air temperature (DAT) is less than target air temp the gas valve will increase in 5% increments until target air temp is achieved.
    » If increased gas valve rate exceeds the overshoot operating temp range the gas valve will decrease by 5% increments until the thermal balance point is established in the adequate air range of the zoning map.
  ◊ For staged units:
    » Heating rate will remain at 70% unless DATS does not report advancement of the DAT quickly enough (approximately 180 seconds) then second-stage will initiate at that time.
    » Second stage will drop out at overshoot operating temp range.
    » The DAT will seek a thermal balance point based on the ratio of minimum CFM to minimum capacity BTU above the overshoot temp.
  ◊ Verify CFM demand is the value selected in setup.
    » The 50% cutback values are related to wiring terminal points, dirty voltage, and excessive IDBP >79%.
    » Once a 50% cutback mode is learned by the ECM due to excessive IDBP it will always begin at 50% cutback.
    » This mode is often associated with the alert code E250.
    » Alert code E250 will occur on every heating call due to inadequate air as the zoning map indicates.
    » Various small percentage cutbacks are most often associated with thermostat wires connected on the damper control module and not on the indoor unit control’s terminals.
  ◊ The indoor blower power is helpful in determining if the zone ductwork has a high static pressure that the blower may not be able to overcome and cause the blower to run in cut back mode.
    » Verify Indoor Blower Power is <79%.
      + **Lower velocity range** is 1% - 30%.
        These have a quiet operation but may require duct balancing for uniform room distribution.
      + **Moderate velocity range** is 30% - 65%.
        These have more noticeable operation but may help overcome path of least resistance duct design.
      + **High velocity range** is 65% - 79%.
        These are very noticeable but an alternative to remodeling the duct system without experiencing blower cutback alert codes E291, E311 and E312.
      + **Excessive velocity range** is 79%-83%.
        These are not recommended due to unwanted velocity and possible blower fluctuation with cutback mode operation. Occasional success may sometimes occur.
in this range but is highly sensitive to air filter loading restriction.

» Select Zoning Control.
  » Verify the appropriate zone damper is 100% open and all others are closed.
  » Verify from discharge air temperature using the following procedures:
    ◊ On modulating units, the value will remain very constant between zones due to the gas valve modulating proportionally with the airflow.
    ◊ On staged units the CFM will determine the DATS value based on a fixed BTU output.
    > Excessive air per zone will drive the DAT below target air setting and initiate 2nd stage
    > 2nd stage will then drive the temperature up to the overshoot limit and drop out with minimum air.
    > The cycle is repeated with minimum 20° fluctuating discharge temperature.
    > Adjust each zone to operate in the adequate air range of the zoning map within the proper IDBP percentage.
    > The position of the DATS should not be changed as it is set for continuous maximum capacity operation within the adequate air range of the zoning map.
      + Verify DATS is tracking slow and steady in .4 -.5 increments. Temperature reading in large increment indicate the CFM may need to be adjusted and IDBP % checked.
      + Verify steady state DATS in diagnostics is approximately the same as DAT operating target as per zoning map. Pocket formula may be needed for this value.
      + if minimum air CFM was selected to specifically accommodate duct sizes >79% IDBP the DAT will run higher as per the zoning map temperature ranges.
      + Verify DAT operating temp is less than zoning heating limit or cool down mode will initiate, and short cycling will occur.

» Repeat for each zone installed
  - Select the next larger zone.
  - Initiate 5° heating call on subsequent zone while previous zone is still on.
  - Wait for the “heating” status symbol to be displayed.
  - Scroll to previous zone and terminate call.

◊ This will prevent unit from cycling off.
◊ Proceed to diagnostics and record results.

» If CFM changes need to be made do not use the test mode. Return to dealer control center > equipment > reset > reconfigure system> stop on the 6th commissioning screen.
  - Adjust CFM per zone as needed.
  - Changes will be saved and stored.

• Cooling test per zone
  » Same sequence as heating.
  » DATS position will not be changed.
  » DATS calibration is sensitive to specific heating performance.
  » DATS calibration in cooling mode.
    - Adjust CFM to respond to target air cooling temp setting selected in zoning setup
    - Adequate air on the zoning map will find a thermal balance point between target and 7° above that temp.
    - If the CFM selected achieves a point inside that range the ODU will not continue to modulate up (staged or modulating units).
    - If the thermal balance point is not close enough to the target air temp selected the CFM can be lowered to achieve that design condition.

» Good practice recommends a balance point within 2°F of target to accommodate for air filter loading restriction
» Discharge air temperature is subject to fluctuate based on differences in total heat load.
» Return to home screen and set all zones to normal operations.

Lennox Communicating Indoor Control Link Settings

When using the iHarmony® zoning system with a Lennox communicating Indoor unit and non-communicating (24VAC) outdoor unit all applicable control links illustrated in “Figure 7. Damper Control Jumpers LEDs and Connections” on page 14 should be configured as indicated. Failure to cut or not cut only the required links will result in the system being inoperable.

iComfort S30 Ultra Smart Thermostat - Installer Zoning
Control Settings

Zone Control Settings during Thermostat Initial Commissioning

If zoning control was added during initial installation of the S30 control system. Perform the following steps:

1. Navigate through the various commissioning screens until you reach Equipment Found screen. Verify that a Zone Control icon is present. If so, the system has detected the equipment. Press continue to proceed.

NOTE: If zoning control is not listed, verify installation of the damper control module and all wiring connections. Make any corrections required and run Re-Configure System feature again.

2. When the iHarmony Zoning screen appears, select each zone listed to rename it if desired. The system provides predefined names or a custom name can be added. Press done when completed and press continue to proceed.

NOTE: If a particular zone is missing from the list, verify that the zone sensor wiring is correct and that the zone address is set correctly on both types of zone sensors (17A30 and 10C17).

3. The Verify Airflow Per Zone screen will appear. Make the requirement CFM adjustment for each zone on this screen. When done, press continue to proceed.

Zone Control Settings after Thermostat Initial Commissioning

If zoning control was added to an existing S30 control system. Perform the following steps:

1. From the Home screen, select the Menu Icon
2. Select Settings
3. Select Advanced Settings
4. Select View Dealer Control Center
5. Select Equipment
6. Select Reset
7. Select Re-Configure System. This will instruct the thermostat to scan for new equipment.
8. Navigate through the various commissioning screens until you reach Equipment Found screen. Verify that a Zone Control icon is present. If present, the system has detected the equipment. Press continue to proceed.

NOTE: If zoning control is not listed, verify installation of the damper control module and all wiring connections. Make any corrections required and run Re-Configure System feature again.

9. When the iHarmony Zoning screen appears, select each zone listed to rename it if desired. The system provides predefined names or a custom name can be added. Press done when completed and press continue to proceed.

NOTE: If a particular zone is missing from the list, verify that the zone sensor wiring is correct and that the zone address is set correctly on both types of zone sensors (17A30 and 10C17).

10. The Verify Airflow Per Zone screen will appear. Make the requirement CFM adjustment for each zone on this screen. When done, press continue to proceed.

Changing Zone Name

If at a later time the zone name needs to be changed, use the following procedure to do so.

1. From the Home screen, select the Menu icon in the upper right-hand corner of the screen.
2. Press settings.
3. Press iHarmony zoning to bring up the zone list. To rename each zone, select the applicable zone.
4. Enter the new zone name by pressing on the zone name field on the right side of the screen.
5. When done, select <iHarmony Zoning to return to the previous screen.
6. Repeat the above procedure to rename any additional zones.

Setting Up Scheduling for Each Zone

To setup schedule for each zone, perform the following:

1. From the master thermostat’s home screen, swipe from right side of the screen to the left to navigate through each zone screen.

Figure 8. Unique Schedule for a Specific Zone
2. Once the desire zone is on the screen, select **modes/schedules**.

3. Select **schedules**

4. From this screen, you may select from any predefined schedules (**schedule IQ, summer, winter, spring/fall** and **save energy**).

**NOTE:** When using predefined schedules, the settings will be the same for all zones that the selected schedule is used in. If you wish a unique schedule for a specific zone, edit one of the existing schedules and rename the schedule to match for example the zone it will be used in.

5. There is also the option to edit schedules. From the edit schedules screen you can modify any of the predefined schedules.

6. Repeat the above procedure for each zone.

**NOTE:** For more information concerning schedules, refer to the thermostat user guide.

### Design and Map Airflow Per Zone Using Target Air Temperatures

#### Mapping Overview
- Mapping the zoning will allow you to select an operating temperature design based on the blower tables.
- Recommended CFM values are listed at mid-range temperature rise values on the equipment name plate.
- Add the temperature rise to the desired room temperature to achieve Operating DAT.
- On staged units the target air temperature setting will be 20° less than your design rounded up to the nearest 5°.
- On modulating equipment the target air temperature will be 10° less than design rounded up to the nearest 5°.
- These values can be manipulated within the blower tables to create the exact Map of your system operation.
- On modulating systems that are oversized the map can configure smaller zones to operate at less BTU/CFM saturation.
- Basically only a portion of the capacity is used while supplying required capacities to smaller zones.
- For Temperature Rise and CFM Pocket formulas see “Table 21. Schedule A” on page 19.
- Excessive air operates below target set point and will initiate increased capacity
- Adequate air allows the system to operate at maximum capacity without staging the heat down. Higher CFM selections operate on lower target air temperatures.
- Minimum air allows the unit to operate at elevated temperatures on minimum capacity without tripping heating limits selected.
- Zoning heating limits can be selected to avoid cool down mode based on absolute minimum cfm allowed in blower tables.
- Insufficient air operates at very high temperatures based on CFM values selected below absolute minimum CFM per zone in blower tables. Non-recommended CFM values are available in the iHarmony minimum CFM design. Such values should be used for ventilation only. Verify maximum CFM per zone based on less than 79% indoor blower power. Cool down mode is forced resulting in continual short cycling of equipment and out of range temperature rises.
- Inadequate air is the absence of enough airflow to avoid complete heat saturation of the heat exchanger resulting in primary limit trips and Central Mode operation. This can be the result of using the lowest iHarmony CFM settings or inadequate ductwork not allowing blower motor to operate less than 79% indoor blower power.

![Design and Map Airflow Per Zone Using Target Air Temperatures](image)
IMPORTANT

All recommended CFM settings are mid-range temperature rise values per stage per unit. All CFM combinations must be <79% indoor blower power.

### Table 21. Schedule A

Notes:
- All gas heat BTU based on product specification output values.
- All electric heat BTU based on 3412 BTU per Kw at 240VAC. If another voltage is used, the BTU value must be taken from the EHB.
- All Kw listed are single phase kits.
- All S15 limits open at 150° F.
- Pocket formulas (must be rounded to iHarmony increments).
- **CFM = BTU / 1.08 / Target Temp Rise**
- Temp Rise = BTU / CFM / 1.08.

</tbody>
</table>
Table 23. Smart Hub Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zone 1 through 4 Heating CFM</td>
<td>The maximum airflow CFM is the factory default value for each particular unit. Depending on each unit’s configuration, the default values may be applied by the gas furnace, the heat pump unit, or the air handler electric heating value. The per zone CFM value is the equal division of the number of zones into the maximum airflow default CFM. These values will be verified and/or adjusted in the procedure listed in “Mapping the Design” on page 9. Specific maximum airflow and per zone CFM is achieved by selecting the mid-range temperature rise values from the CFM tables listed under “Zoning CFM Tables” on page 17, that will operate &lt;79% IDBP during the test procedures listed under “Testing the Zones” on page 11 and “Sizing the System” on page 10. iHarmony minimum CFM listed below will exceed proper temperature rise operating ranges. Do not use any value less than the absolute minimum CFM listed in the blower tables regardless of tonnage value. The minimum CFM is 250 CFM for 3-ton, 380 for 4-ton or 450 CFM for 5-ton to the maximum. Adjustment are in 5 CFM increments.</td>
</tr>
<tr>
<td>Zoning Anticipated Discharge Air Temperature Adjustment</td>
<td>This parameter setting compensates for a rapid change of the discharge air temperature due to fast changing conditions. It examines the change in the discharge air temperature for the previous two minutes and extrapolates or looks forward by the number of seconds set in the parameter and uses this as the DATS value for staging. This parameter setting helps prevent limit trip/ frozen coil from occurring. Range is 0 to 120 seconds. Default is 0 seconds. Adjustments are in increments of 5 seconds.</td>
</tr>
<tr>
<td>Zoning Gas Heating DAT Cool Down Target</td>
<td>At the end of a gas cycle, the Heat Blower Off-Delay may not be long enough to completely cool the heat exchanger. This may result in a primary limit trip then, or at the beginning of the next heat demand. This parameter allows the blower to run after a gas heat call ends until the discharge air temperature sensor (DATS) cools to the temperature set in the parameter. If the temperature is set too low this will cause the temperature in the room to overshoot. Range is 80 to 90°F (26.67 - 32.22°C). Default is 90°F (32°C). Adjustments are in increments of 1°F (0.56°C).</td>
</tr>
<tr>
<td>Zoning Initial Staging Hold Time for Gas Heating</td>
<td>In zoning systems, the furnace was upstaging before the discharge air sensor reached a steady-state value and it would sometimes trip a limit due to staging up the gas before the blower would even come on (as occurs during pressure switch calibration). The furnace has satisfied the original call for heating and may still have residual heat in furnace when a second heat demand is called for. This parameter will not allow for the second call of heating before the delay timer has expired. This parameter allows an adjustment on top of the initial delay for a heating call. Range is 3.0-8.0 minutes with a default of 5.0 minutes. Can be adjusted in 1-minute increments.</td>
</tr>
<tr>
<td>Zoning Minimum Zone Run-Time</td>
<td>Range is 90 to 600 seconds. Default is 120 seconds. Adjustments are in increments of 30 seconds.</td>
</tr>
</tbody>
</table>

Table 23. Smart Hub Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Zoning Supply Air Temp Limit for Cooling</td>
<td>In cooling mode, this setting sets the discharge air temperature low limit. Below this temperature, the cooling is turned off. During cooling testing set the Zoning Supply Air Temp Limit for Cooling low enough (far enough away) so that the outdoor unit does not have nuisance low pressure switch trips caused by a sudden drop in supply air temperature as dampers close. Range is 35 to 45°F (1.67 - 7.22°C). Default is 40°F (4.44°C). Adjustments are in increments of 1°F (0.56°C).</td>
</tr>
<tr>
<td>Zoning Supply Air Temp Limit for Gas / Electric Heating</td>
<td>In heating mode, this setting sets the target discharge air temperature. Range is 120 to 160°F (48.88 to 54.44°C). Default is 125°F (52°C). Adjustments are in increments of 5°F (2.78°C).</td>
</tr>
<tr>
<td>Zoning Target Supply Air Temp for Cooling</td>
<td>In heat pump heating mode, this setting sets the target discharge air temperature. Range is 85 to 110°F (29.44 to 43.33°C). Adjustments are in increments of 1°F (0.56°C). Default 90°F (32°C) plus 7 degrees operating range in all units above this setting. Adjustments are in increments of 1°F (0.56°C).</td>
</tr>
<tr>
<td>Zoning Target Supply Air Temp for HP Heating</td>
<td>In cooling mode, this setting sets the discharge air temperature. Range is 120 to 160°F (48.88 to 54.44°C). Default is 125°F (52°C). Adjustments are in increments of 5°F (2.78°C).</td>
</tr>
<tr>
<td>Zoning Target Supply Air Temp for Gas/ Electric Heating</td>
<td>In heating mode, this setting sets the target discharge air temperature. Range is 120 to 160°F (48.88 to 54.44°C). Default is 125°F (52°C). Adjustments are in increments of 5°F (2.78°C).</td>
</tr>
</tbody>
</table>

Zoning Sequence of Operations

When power is first applied, the green Status LED will flash, indicating that the damper control is functioning normally. When the control is first powered on, there is a 5 minute minimum time delay during which only the fan output will respond.

Heating / Cooling Changeover

The following is an example of how the system operates during a heating / cooling changeover. When the system is satisfying a call from zone 1 for heating and receives a call for cooling from zone 2, the following will occur:

1. Then system will continue to fulfill the demand from zone 1 until satisfied, or a maximum time of 20 minutes has occurred.
2. If after 20 minutes the system is still operating based on satisfying the heating demand from zone 1, the system will terminate that demand.
3. The system will then shut system down for five (5) minutes. This will allow for system temperatures and operating pressures to stabilize.
• After a five 5 minute delay the system will begin operations to satisfied the cooling demand from zone 2.

The system will continue to operate in this matter each time it receives a zone call that is opposite of the current mode of operation (heating or cooling).

**Damper Operation**

**Cooling Operation Conventional Heat/Cool and Heat Pump Systems**

When a zone thermostat makes a demand for cooling, the zone damper opens and the cooling equipment begins operating. Cooling demand is terminated when:

1. All zone demands for cooling are terminated.
2. The demand has exceeded the heat/cool changeover time limit (20 minutes) while a heat demand exists.

When cooling demand is terminated, a 5 minute minimum off time delay is initiated.

Second stage cooling is energized when the discharge air temperature is 7°F higher than the set point of the cooling staging temperature settings.

**Heating Operation Conventional Heat/Cool and Heat Pump Systems**

When a zone thermostat makes a demand for heating, the zone damper opens and heating equipment begins operating. Heating demand is terminated when:

1. All zone demands for heating are terminated.
2. The demand has exceeded the heat/cool changeover time limit (20 minutes) while a cooling demand exists.

When heating demand is terminated, a 5 minute minimum off time delay is initiated. Second-stage heating is energized if the discharge air temperature is lower than the set point of the heating staging temperature set point.

**Dual-Fuel Operation**

**NOTE:** A 10T50 Interface Module is required for non-communicating dual-fuel applications.

When both a gas furnace and a heat pump are present on the system, the thermostat uses the balance points to determine which source to use for heating.

When the outdoor temperature is above the low balance point, the heat pump is always attempted first before using the gas furnace.

In order to use the gas furnace as a primary heating source (not defrost tempering) when the outdoor temperature is between the high and low balance points, the following conditions must occur:

• Heat pump must be used for a minimum of 30 minutes.
• Temperature in the zone not increase by more than 0.5°F
• Heat pump has not gone into defrost in the 30 minute period

If any single-zone satisfies the specified conditions, the heat pump will stop and the gas furnace is used to satisfy all heat calls for the next duration of the parameter heat pump lockout time. After the heat pump lockout has expired, the heat pump is again used as the primary heat source on the next call after the equipment has stopped.

**Emergency Heat Operation - Heat Pump Systems**

When the Lennox communicating thermostat emergency heat is enabled the unit will satisfy all heating demand with either gas or electric backup heat. When the Emergency Heat setting is OFF, the heat pump is used to satisfy heating demands.

**Humidity Control**

Refer to Lennox communicating thermostat installation and setup guide for more information on humidity control settings and operating modes.

Note, there no controls modes, while in zoning mode, to actively humidify or dehumidify, to obtain a certain dew-point or relative humidity.

Various control modes to actively humidify or dehumidify would be available when the iComfort S30 or iComfort Wi-Fi are switched to whole-home mode (non-zoning).

**Soft Disable**

Soft disabling is when the Lennox communicating thermostat finds an unknown control on the S30 system communication bus. The thermostat sends the unknown control a message to go into soft disable mode until the component is properly configured or removed.

Sometimes soft disable will occur when a control is being replaced. Reconfiguring the system should resolve this issue.

The Lennox communicating thermostat will not show a alert code for a soft disabled control. When soft disabling occurs only the control that has been disabled will display the blinking LED status or seven-segment display indicator. Refer to the device’s installation and setup guide for further guidance.

The iComfort control with the soft disable state will indicate so as follows:

• On air handler, integrated furnace and outdoor controls, the soft disable state is display by double horizontal lines on seven segment display.
• On iHarmony damper control module the green LED will blink 3 seconds on and 1 second off.

**Possible Cause**

• Soft disable may occur when a control has been replaced. Reconfiguring the system should resolve this issue.
• Sometimes Lennox communicating thermostat detects a new device or an existing device or a device on the system that is not communicating with the thermostat. If this occurs, an alert code 10 is activated and the thermostat...
sends a soft disable command to the offending device on the communications bus (outdoor control, IFC, AHC, EIM, or damper control module).

Re-Configure System

Use the following procedure if any controls are displaying the soft disable indicator:

1. Confirm proper wiring between all devices such as thermostat and Smart Hub.
2. Cycle power.
3. Go to the menu > settings > advanced settings > view dealer control center. Touch proceed to continue.
4. Select equipment.
5. Touch reset.
6. Touch re-configure system.
7. Select confirm to continue.
8. The thermostat will reboot and start through the system commissioning procedure.

Troubleshooting

Steps to follow if the damper control module is displaying the soft disable code

1. Confirm proper wiring between all devices (thermostat, damper control module, indoor and outdoor).
2. Cycle power to the control that is displaying the soft disable code.

Resetting the Thermostat or HVAC Equipment

NOTE: Resetting the thermostat or any HVAC component will remove all parameter adjustments. The system will need to be re-commissioned.

1. From the home screen select menu / settings / advanced settings / view dealer control center / equipment / thermostat and scroll down to reset Thermostat.
2. From the home screen select menu / settings / advanced settings / view dealer control center / equipment / reset and scroll down to reset HVAC equipment.

NOTE: Various control modes to actively humidify or dehumidify would be available when the iComfort S30 or iComfort Wi-Fi are switched to whole-home mode (non-zoning).

Zoning Alert Codes

To expand a specification notification to access a more detail description of the alert code, press the down arrow to expand the description.

- Critical alerts are displayed on Home (user) screen, in the Homeowner alert button, and in the Installer alert button. Critical means that a service call is needed to get the system running.
- Moderate alerts are found only in the Installer alert button.

<table>
<thead>
<tr>
<th>Alert Code</th>
<th>Priority Condition</th>
<th>Actual Displayed Alert Text</th>
<th>Component or System Operational State and Troubleshooting Tip</th>
<th>How Alert Code is Cleared</th>
</tr>
</thead>
</table>
| 10         | Critical           | Unknown Device Detected - DEVICE2 | The thermostat when NOT in configuration mode has detected an unknown device. Typically the thermostat will send a command to the unknown device and place the device into a soft disable state. The soft disable control will indicate so as follows:  
- On air handler, furnace and outdoor controls, the soft-disabled state is displayed by double horizontal lines on seven-segment display.  
- On the damper control module, the green LED will flash 3 seconds on and 1 second off.  
- On the equipment interface module, the green LED will flash 3 seconds on and 1 second off.  
- A new communicating device has been added to the system since the original configuration setup was completed.  
- Go to menu > settings > advanced settings > view dealer control center > equipment and press reset all equipment. This will allow the system to auto-detect any Lennox communicating devices attached. | Clear alert code by reconfiguring the system. |
Table 24. Alert Codes and Troubleshooting

Initial notification of critical alerts will pop up on the home screen and will be listed under notification menu. Minor and moderate alerts are found only under the notification menu.

<table>
<thead>
<tr>
<th>Alert Code</th>
<th>Priority Condition</th>
<th>Actual Displayed Alert Text</th>
<th>Component or System Operational State and Troubleshooting Tip</th>
<th>How Alert Code is Cleared</th>
</tr>
</thead>
</table>
| 11         | Critical           | Missing DEVICE2             | The thermostat cannot find a previously installed system component.  
• Check all system components (devices) connections to make sure they are Lennox communicating compatible.  
• Cycle system power.  
• If problem persists, then check all system components (devices) connections to make sure they are Lennox communicating compatible.  
• Go to menu > settings > advanced settings > view dealer control center > equipment and press reset all equipment. This will allow the system to auto-detect any Lennox communicating components attached. | Cycle system power, and if problem persists then clear by reconfiguring the system. |
| 105        | Critical           | Communication Problem       | A system component (zone sensor for example) has lost communication with the system. System component (device) is unable to communicate.  
• This may indicate the existence of other active alert codes.  
• In most cases errors are related to electrical noise. Verify that high voltage power is separated from the low voltage communication wires.  
• Check for incorrectly wired or loose connections between system components (devices).  
• Check for a high voltage source of noise close to the system. | Automatically clears when the system detects the issue no longer exists. |
| 114        | Moderate / Critical| AC Line Frequency / Distortion Prob | There is a frequency / distortion problem with the power to a specific system component. There is a frequency / distortion problem with the power to a specific system component.  
• This alert code may indicate transformer overloading.  
• Check the voltage and line power frequency.  
• Check the generator operating frequency, if the system is running on back-up power.  
• Correct voltage and frequency problems.  
• System will resume normal operation five seconds after fault recovered.  
• All applicable system component outputs are disabled – moderate condition.  
• After 10 minutes, the priority condition is escalated – critical condition.  
• Damper control module will operate in central mode only until proper voltage is restored or frequency distortion is resolved – moderate condition.  
• Set damper control module transformer jumper to system transformer. Check for proper wiring. Replace 40VA furnace transformer with 70VA transformer. Re-commission system. | Automatically clears when the system detects the issue no longer exists. |
| 115        | Critical           | Low Secondary (24VAC) Voltage | 24VAC power to a system component control is lower than the required range of 18 to 30VAC.  
• Check and correct voltage.  
• Check for additional power-robbing system components (devices) connected to system.  
• This alert code may require the installation of an additional or larger VA transformer.  
• Damper control module will operate in non-zone mode until proper voltage is restored. | Automatically clears when the system detects the issue no longer exists. |
| 120        | Moderate           | Unresponsive DEVICE2.       | There is a delay in the system component responding to the system. Typically this alert code does not cause any operational issues and will clear on its own.  
• This alert code is usually caused by a delay in the outdoor unit responding to the thermostat.  
• Check all wiring connections. | Automatically clears after an unresponsive system component (device) responds to any inquiry. |
Table 24. Alert Codes and Troubleshooting

Initial notification of critical alerts will pop up on the home screen and will be listed under notification menu. Minor and moderate alerts are found only under the notification menu.

<td>The furnace primary limit switch is open. If limit switch is not closed within three minutes, the unit will go into a 60 minute soft lockout (Watchguard mode). Perform the following:</td>
<td>Automatically clears when a heat call ends successfully.</td>
</tr>
<tr>
<td></td>
<td>Primary Limit</td>
<td>• Check for high gas pressure.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch Open</td>
<td>• Check for low supply air. Low supply air due to being plugged or restriction in system (example: dirty air filter or blockage in duct work).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Check for proper firing rate on furnace.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Check for non-functioning zone dampers.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE:</strong> Limit trips will place the iHarmony zoning system into non-zone mode.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE:</strong> See ACC-14-01 for further details.</td>
<td></td>
</tr>
<tr>
<td>252</td>
<td>Moderate</td>
<td>A discharge air-temperature is high. Perform the following:</td>
<td>Automatically clears when a heat call ends successfully.</td>
</tr>
<tr>
<td></td>
<td>Discharge Air</td>
<td>• Check temperature rise, air flow and input rate.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Temperature High</td>
<td>• Check for dirty air filter(s).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>NOTE:</strong> See Service and Application Note ACC-14-01 for further details.</td>

Table 24. Alert Codes and Troubleshooting

Initial notification of critical alerts will pop up on the home screen and will be listed under notification menu. Minor and moderate alerts are found only under the notification menu.

<table>
<thead>
<tr>
<th>Alert Code</th>
<th>Priority Condition</th>
<th>Actual Displayed Alert Text</th>
<th>Component or System Operational State and Troubleshooting Tip</th>
<th>How Alert Code is Cleared</th>
</tr>
</thead>
</table>
| 310        | Moderate           | Discharge Air Temp Sensor Problem | There is a discharge air temperature sensor issue.  
• Compare discharge temperature sensor (DATS) resistance to temperature / resistance charts in system component installation instruction.  
• Replace discharge air sensor if necessary.  
**NOTE:** Confirm there is no short or open circuits in the iComfort thermostat connections to any of the other components in the communication system.  
**NOTE:** Issues with a DATS connected to a damper control module or equipment interface model will not generate an alert code. | Automatically clears 30 seconds after condition is detected as recovered or after system restart. |
| 530        | Moderate / Critical | Low Damper 24VAC Voltage | • Check 24VAC voltage to all dampers.  
• Check 24VAC damper transformer.  
• Check connections. | Replace transformer if applicable. Automatically clears when the condition no longer exists. |
| 532        | Moderate           | Zoning Pressure Switch Opened (High Pressure) | Zoning Pressure Switch Opened (high pressure)  
• Compressor pressure is above the specified limit.  
• Compressor is turned off.  
• Zoning will be restored once the high pressure switch closes. Occasionally we get this with an AC system and the fix is to just jump out the pressure switch terminals on the damper control module board.  
**NOTE:** Zone heating will continue to operate in zoning mode with Aux heat until the pressure switch resets. | Automatically clears after compressor pressure is within limits. |
| 542        | Critical           | Zone 1 Temp Sensor Problem | Possible Causes:  
• Zone temperature sensor reading out of range.  
• Check for loose or mis-wired connections at the zone sensor or damper control module terminals  
• Open or short zone temperature sensor detected for more than five second.  
• More than one zone sensor has the same assigned address Check zone sensor(s) address. | Automatically clears 30 seconds after condition no longer exist. |
| 543        | Critical           | Zone 2 Temp Sensor Problem | | |
| 544        | Critical           | Zone 3 Temp Sensor Problem | System Response:  
• On both types of zone sensor the Indoor temperature will display “--” on the home screen.  
• Damper control module will operate in central mode (all dampers open) in both moderate and critical priority conditions.  
• If after 10 minutes the condition does not change, the applicable alert code (542, 543, 544 or 545) is escalate by the iComfort communicating thermostat to critical. System will continue to operate in central mode.  
• At the iComfort communicating thermostat, only zone 1 screen will be available. The iComfort communicating thermostat will display the alarm as “Problem (Zoning Control)”. Email notifications will describe the issue as “Zone “X” Temp Sensor Problem. | |
| 545        | Critical           | Zone 4 Temp Sensor Problem | | |
| 551        | Critical           | Lost Communication* | Any lost communication between the zone sensor and damper control module will result in the applicable error code being display (543, 544 or 545) at the thermostat.  
• A pop-up display will appear indicating communication error.  
• Indoor temp is displayed as “--” on the home screen.  
• When any zone sensor loses communication with the damper control module, the entire system will go into central mode. Check wiring between damper control module and the zone sensor reporting error code 551. | Once communication is reestablished the zone sensor will return to normal zone operations. |
Table 24. Alert Codes and Troubleshooting

Initial notification of critical alerts will pop up on the home screen and will be listed under notification menu. Minor and moderate alerts are found only under the notification menu.
