Installation/Operation Instructions

Mini-VRF Heat Pump

VPA***H4-2P
VRF SYSTEMS
OUTDOOR UNITS
507641-07
04/2018

⚠️ CAUTION
As with any mechanical equipment, contact with sharp sheet metal edges can result in personal injury. Take care while handling this equipment and wear gloves and protective clothing.

⚠️ IMPORTANT
The Clean Air Act of 1990 bans the intentional venting of refrigerant (CFC’s and HCFC’s) as of July 1, 1992. Approved methods of recovery, recycling or reclaiming must be followed. Fines and/or incarceration may be levied for non-compliance.

General
The Mini-VRF heat pump outdoor units are matched with up to nine indoor units to create a VRF (variable refrigerant flow) system that uses R-410A refrigerant. Refer to the Product Specification bulletin (EHB) for the proper use of these heat pumps with matching indoor units, branch boxes, branch pipes, line sets and controls.

These instructions are intended as a general guide and do not supersede local or national codes in any way. Authorities having jurisdiction should be consulted before installation.

Shipping and Packing List
Check the components for shipping damage. If you find any damage, immediately contact the last carrier. Package 1 of 1 contains the following:
1 - Assembled Mini-VRF heat pump outdoor unit
1 - Outdoor unit installation instruction

⚠️ WARNING
Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life.
Installation and service must be performed by a licensed professional HVAC installer, service agency or the gas supplier.
Failure to follow safety warnings and these instructions exactly could result in property damage, dangerous operation, serious injury, or death.
Any additions, changes, or conversions required in order for the appliance to satisfactorily meet the application needs must be made by a licensed professional HVAC installer (or equivalent) using factory-specified parts.
Do not use this system if any part has been under water. A flood-damaged appliance is extremely dangerous. Immediately call a licensed professional HVAC service technician (or equivalent) to inspect the system and to replace all controls and electrical parts that have been wet, or to replace the system, if deemed necessary.

THIS MANUAL MUST BE LEFT WITH THE OWNER FOR FUTURE REFERENCE
These instructions are intended as a general guide and do not supersede local codes in any way. Consult authorities having jurisdiction before installation.

General
The Mini-VRF heat pump outdoor units are matched with up to nine indoor units to create a VRF (variable refrigerant flow) system that uses R-410A refrigerant. Refer to the Product Specification bulletin (EHB) for the proper use of these heat pumps with matching indoor units, branch boxes, branch pipes, line sets and controls.

1 - Outdoor unit installation instruction
Safety Requirements

⚠️ WARNING

ELECTRICAL SHOCK, FIRE, OR EXPLOSION HAZARD.
Do not touch the unit or the controller if your hands are wet.
Do not operate appliances with an open flame near the unit.
Do not replace a fuse with a fuse of a different rating. Do not use a jumper wire to replace a fuse. Do not insert your hands, tools or any other item into the air intake or air outlet at either the indoor or outdoor unit.
Do not allow children to operate the system.

Model Number Identification

Brand/Family
V = Variable Refrigerant Flow (VRF)

Unit Type
P = Heat Pump Outdoor Unit

Major Design Sequence
A = 1st Generation

Nominal Cooling Capacity - Tons
036 = 3 Tons
048 = 4 Tons
060 = 5 Tons

Voltage
P = 208/230V-1 phase-60hz

Minor Design Sequence
1 = 1st Revision
2 = 2nd Revision
3 = 3rd Revision

Refrigerant Circuits
M = Multiple Circuits

Refrigerant Type
4 = R-410A

Cooling Efficiency
H = High Efficiency

NOTE - Lennox VRF and Lennox Mini-Split products are similar in appearance to each other. Refer to the unit’s model number to determine if the unit is a VRF (V) or Mini-Split (M) unit. It is not possible to mix the two types of equipment on any system.

System Piping

⚠️ CAUTION

VRF system piping is customized for each installation. The Lennox VRF Selection Software (LVSS) piping report is an engineered design that must be followed. The piping diagram or diagrams included within the LVSS report have been prepared based on the information provided to the Lennox VRF applications department. When the indicated lengths change from the figures stated within the report, it is imperative that prior to the commencement of the refrigerant pipe work installation, Lennox VRF applications department are informed of these proposed changes.

⚠️ CAUTION

Upon receipt of this new information the Lennox VRF applications department will confirm any changes that may be applicable to this installation. If changes are required, a new piping diagram will be produced and will supersede all other previously provided documents. Failure to provide this information regarding changes to the original design may lead to insufficient capacity, equipment failure, warranty being made void and the refusal to commission the system.

Installation Clearances - inches (mm)

Single Unit Installation

(Wall or Partition)

Air inlet

12 (305) Minimum

Front of Unit

Air Outlet

79 (2007) Minimum

Air Inlet

12 (305) Minimum

24 (610) Minimum

(Service Clearance)

NOTE - 24 in. (610 mm) clearance required on top of unit.

Parallel Units Side by Side

(Wall or Partition)

12 (305) Minimum

24 (610) Minimum

(Service Clearance)

Front of Units

NOTE - If unit is surrounded on three or four sides by walls or partitions that are taller than 10 ft. (3 m), call Lennox VRF Applications group to discuss additional requirements.

Parallel Units Back to Back, Facing and Front to Back

(Wall or Partition)

20 (508) Min.

118 (2997) Min.

118 (2997) Min.

12 (305) Min.
Outdoor Unit Positioning Considerations
In addition to clearances, the following items should be considered when setting the outdoor unit:

- Some local governments have adopted sound ordinances based on the unit’s sound level registered from the adjacent property, not from the property where the unit is installed. Install the unit as far as possible from the property line.
- Glass has a very high level of sound transmission. When possible, do not install the unit directly outside a window.
- Avoid installing the unit in areas exposed to extreme voltage variations (such as factories).
- Install unit level.
- Install the unit high enough above the ground or roof to allow adequate drainage of defrost water and prevent ice or snow build-up (required for heat pumps).
- The unit base should be elevated above the depth of average snows. In heavy snow areas, do not locate the unit where drifting will occur.
- When installed in areas where low ambient temperatures exist, locate unit so winter prevailing winds do not blow directly into outdoor unit.
- Locate unit away from overhanging roof lines which would allow water or ice to drop on, or in front of, coil or into unit.
- Allow sufficient space around unit for proper operation and maintenance.
- Install the outdoor unit a minimum of 3 feet away from any antenna, power cord (line), radio, telephone, security system, or intercom. Electrical interference and radio frequencies from any of these sources may affect operation.

WARNING
Use the provided and specified components when installing equipment. Failure to do so may result in unit falling, water leaking or electrical shocks, causing personal injury or equipment or property damage. Check stability of unit support. If support is not capable of carrying weight of the unit, unit may fall causing personal injury or equipment damage. Safely dispose of packing materials, which include nails, wood and other sharp objects, as well as plastic wrapping. Children playing with plastic wrap or bags risk the danger of suffocation.

Lifting the Unit
- Do not hold the air inlet grille while lifting the unit. This could result in damage to the cabinet.
- Do not touch the fan blades with your hands or other objects while lifting the unit.

IMPORTANT
Exhaust vents from dryers, water heaters and furnaces should be directed away from the outdoor unit. Prolonged exposure to exhaust gases and the chemicals contained within them may cause condensation to form on the steel cabinet and other metal components of the outdoor unit. This will diminish unit performance and longevity.

SLAB OR ROOF MOUNTING
Install the unit a minimum of 4 inches (102 mm) above the roof or ground surface to avoid ice build-up around the unit. Locate the unit above a load bearing wall or area of the roof that can adequately support the unit. Consult local codes for rooftop applications.
- Use a field-provided slab or frame as specified in the Product Specifications (EHB) bulletin.
- Install the unit in an upright and level position.
- If the unit coil cannot be installed away from prevailing winter winds, a wind barrier should be constructed. Size barrier at least the same height and width as outdoor unit. Install barrier 12 inches (305 mm) minimum from the sides of the unit in the direction of prevailing winds.
Securing Outdoor Unit to Slab or Frame
- Brackets are provided at the base of the outdoor unit so that it can be secured to a field-provided slab or frame.
- Use lag bolts or equivalent to secure the outdoor unit to the slab or frame. Figure 1.

Condensate Drains
- The bottom of the outdoor unit is equipped with multiple drain holes to route water away from the unit during a defrost cycle. See figure 3.
- If water produced during the defrost cycle is not drained away from the unit before it re-freezes, the drain may be blocked by ice.
- Protect drain holes to avoid access to the inside of the unit by bugs and other pests.
- Use a field-provided base pan if required for the application.

Securing Outdoor Unit to Wall-Mounted Brackets
- Units can be secured to field-provided wall-mounted brackets as long as the following conditions are met.
- Use lag bolts or equivalent to secure the outdoor unit to the wall-mounted brackets. Figure 2.
- Maintain proper air flow clearances.

NOTE - Minimum rear clearance can be 6 inches (152 mm) when mounted on brackets and with no obstructions on the other three sides.

NOTE - Minimum rear clearance can be 6 inches (152 mm) when mounted on brackets and with no obstructions on the other three sides.

Cold Climate Considerations

**CAUTION**

When operating the heat pump in a low outdoor ambient temperature, be sure to follow the instructions described below.

- To prevent exposure to wind, install the outdoor unit with its suction side facing the wall.
- Never install the outdoor unit at a site where the suction side may be exposed directly to wind.
- To prevent exposure to wind, install a wind barrier on the air discharge side of the outdoor unit.
- In heavy snowfall areas, select an installation site where the snow will not affect the unit.

**Snow and Ice Protection**

- Install the unit high enough above the ground or roof to allow adequate drainage of defrost water and prevent ice or snow build-up.
- Carefully consider how to manage defrost water disposal to prevent ice from blocking walkways or creating a safety hazard near the outdoor unit.
- In heavy snow areas, do not locate the unit where drifting will occur. The unit base should be elevated above the depth of average snows. Locate unit away from overhanging roof lines which would allow water or ice to drop on, or in front of, coil or into unit.
- There must be unobstructed air flow around the air inlet and the air outlet.
- The unit must not be installed in areas where a flammable gas leak may occur.

**NOTE** - VPA***H4-2P units have a factory-installed base pan heater.
Prevailing Winds Protection

If unit coil cannot be installed away from prevailing winter winds, some method of protecting the coil is required. Minimum clearances from wind barrier must be observed at all times. Common application examples are:

- Construct a wind barrier. Size barrier at least the same height and width as outdoor unit. Install a barrier 12 inches (305 mm) minimum from the sides of the unit in the direction of prevailing winds.
- Install outdoor unit in dog house-style shelter.
- Install outdoor unit in alcove, under roof overhang.

NOTE - Minimum rear clearance can be 6 inches (152 mm) when mounted on brackets and with no obstructions on the other three sides.

Figure 8. Unit with Wind Barrier
Buried Refrigerant Pipe Protection

- **All** refrigerant lines must be insulated regardless of if it is buried.
- In addition to insulating each line of piping, buried lines must rest inside a **sealed, watertight** conduit.
- The conduit must be designed so it cannot collect and retain water.

**NOTE** - Minimum clearances apply.

Figure 10. Unit installed in Alcove

Figure 11. Buried Refrigerant Pipe Protection
Installing the Unit Inside of Building

Mini-VRF outdoor units may be installed indoors if the following guidelines are followed.

- Refer to Figure 12 for critical clearances.
- If field-fabricating ductwork to directly discharge air outdoors, use the dimensions shown in Figure 15 as a guide.
- Include inspection doors in discharge ductwork within 12 inches (305 mm) of the unit.
- Do not restrict access to the unit’s electrical service panel.

Supply air inlet requirements
1721.06 sq.in. or
CFM = 4100

NOTES - Louver angle should not exceed 15°.
24 in. (610 mm) clearance required on top of unit.
Makeup air requirements are equal to or greater than discharge air volume. Size makeup air openings appropriately to supply adequate air for the outdoor unit.
Unit clearances apply.
Check fan load amps (FLA), during Forced Cooling operation, after installation.
Install a field-supplied drain pan under the unit.

Allow enough space between the unit and exterior wall to allow for coil service.
Provide a drain pan underneath the unit to prevent condensation leaks.
Contact VRF Applications support for guidance for your application.
email: vrftechsupport@lennoxind.com
phone: 844-GET-VRF1 (844-438-8731)

NOTES: Louver angle should not exceed 15°.
24 in. (610 mm) clearance required on top of unit.
Makeup air requirements are equal to or greater than discharge air volume. Size makeup air openings appropriately to supply adequate air for the outdoor unit.
Unit clearances apply.
Check fan load amps (FLA), during Forced Cooling operation, after installation.
Install a field-supplied drain pan under the unit.

Figure 14. Ducted Discharge Considerations

Figure 15. Unit Front Dimensions
Refrigerant Piping Connections

⚠️ WARNING

Refrigerant leaks are unlikely; however, if a refrigerant leak occurs, open a door or windows to dilute the refrigerant in the room. Turn off the unit and all other appliances that may cause a spark. Call a licensed professional HVAC technician (or equivalent) to repair the leak.

Use only R410A refrigerant to charge this system. Use of other refrigerant or gas will damage the equipment.

Do not allow air or other contaminants to enter system during installation of refrigerant piping. Contaminants will result in lower system capacity and abnormally high operating pressures and may result in system failure or explosion.

Insulate all refrigerant piping.

Refrigerant pipes may be very hot during unit operation. Do not allow contact between wiring and bare copper pipes.

After refrigerant piping connections have been completed, check the system for leaks per commissioning instructions.

Table 1 lists the connection sizes at the outdoor unit. The connections are made using the provided brass flare nuts at the end of the refrigerant piping connections. Both liquid and gas (vapor) lines must be individually insulated.

<table>
<thead>

<td></td>
</tr>
<tr>
<td>VPA060H4</td>
<td>3/8 in.</td>
<td>3/4 in.</td>
</tr>
</tbody>
</table>

Figure 16. Refrigerant Piping / Wiring Inlets

Both liquid and gas (vapor) lines must be individually insulated.

Field piping consists of two field-provided copper refrigerant lines connected to the outdoor unit. These lines carry the liquid and vapor refrigerant to and from the indoor unit(s).

- The three-ton VPA036H4 can provide cooling to as many as five indoor units.
- The four-ton VPA048H4 can serve up to seven indoor units.
- The five-ton VPA060H4 can serve up to nine indoor units.

Refrigerant piping and wiring connections can be brought into the outdoor unit through openings provided in the front and side of the unit. See Figure 16.
When multiple indoor units are served by a single outdoor unit, the refrigerant piping must be connected using either branch box(es) or individual branch pipes. Optional branch box V8MIDB01 and branch pipes V8IDBP01 and V8IDBP02 are ordered separately.

Each branch box can be used to connect a maximum of four indoor units to the outdoor unit. When the system includes five, six, seven, or eight indoor units, two branch boxes must be used. When the system includes nine indoor units, three branch boxes must be used.

A minimum of 39 inches (991 mm) of straight pipe into the branch box.

A minimum of 20 inches (508 mm) of straight pipe out of the branch box. See Figure 17.

When using branch pipes to connect multiple indoor units with a single outdoor unit, each indoor unit requires a separate branch pipe to connect both the liquid and gas (vapor) line to the system. Install these optional devices per the installation instructions provided with them. See the piping schematics on the following pages.

![Figure 17. Straight Pipe In and Out](image-url)
**NOTE** - Always slide a flare nut onto the field-provided refrigerant piping before flaring the lines.

1. The seal on the unit refrigerant piping connections should remain in place until the last possible moment. This will prevent dust or water from getting into the refrigerant piping before it is connected.

2. Remove the flare nuts from the connections on the unit and discard the seal from each of the piping connections.

3. Slide the flare nuts onto the ends of the field-provided refrigerant piping before using a suitable flaring tool to flare the end of the copper pipe.

4. Apply recommended R-410A refrigerant lubricant to the outside of the flared refrigerant lines (Figure 18-A).

5. Align the threaded connections with the flared refrigerant lines. Tighten the flare nuts lightly at first to obtain a smooth match (Figure 18-B).

**IMPORTANT**
The compressor in this unit contains PVE oil (Polyvinylether). PVE oil is formulated for hydrofluorocarbon (HFC) refrigerants, such as R-410a, which this system contains. While it may have some miscibility properties with mineral-based oil and POE oil (Polyolester), it is not recommended to mix PVE oil with any other type of refrigerant oil.

6. Once snug, continue another half-turn on each nut which should create a leak-free joint. A torque wrench may be used to tighten flare nuts using table 2 recommendations. See Figure 19. **Do not over-tighten a flared joint. Flared connections should always be accessible and must be insulated to prevent condensation.**

7. Branch pipe connections may be brazed. It is necessary to purge the pipes with nitrogen during brazing to avoid oxidation which may block the refrigerant piping.

**IMPORTANT**
Always use two wrenches when tightening flare nuts to avoid twisting refrigerant piping. **DO NOT over-tighten flare nuts.**

![Figure 19. Tighten Flare Nut](image)

<table>

</tbody>
</table>

**NOTES:**

If the total capacity of the indoor units is greater than 100% of the capacity of the outdoor unit, individual indoor unit capacities will be reduced.
The seal on the unit refrigerant piping connections should remain in place until the last possible moment. This will prevent dust or water from getting into the refrigerant piping before it is connected.

Flow the pipework with dry (oxygen-free) nitrogen (2.9 psig or 3 CFH) during brazing to avoid oxidation which may block the refrigerant piping.

Do not use anti-oxidants when brazing.

Do not use flux when brazing copper-to-copper piping. Use phosphor copper brazing filler alloy (BCuP) which does not require flux. Flux has a harmful effect on refrigerant pipe.

Use a wet cloth to insulate the shut-off valve during brazing.

Use dedicated gauges and hoses with R-410A equipment.

**Pressure Test**

Follow the pressure test specifications in table 1 for pressure test.

Use oxygen-free nitrogen to pressure test to 647 psig and hold for 1 hour.

**Evacuate System**

Follow the Lennox pressure test specifications in table 1 and the triple evacuation process described on this page to pressure test and evacuate the system.

Use a vacuum pump capable of evacuating to lower than 500 Microns (0.5 Torr).

Do not open any of the outdoor unit shut-off valves (possible max 5 valves). The outdoor unit does not need to be evacuated.

Evacuate the system to 500 Microns (0.5 Torr), or below, for 4 hours.

**Figure 21. Brazing Best Practices**

</tr>
<tr>
<td>4</td>
<td>32 bar</td>
<td>470 psig</td>
<td>24 hours. Lower system pressure test, after confirmation No. 4 was successfully completed.</td>
</tr>
</tbody>
</table>

**Triple Evacuation Procedure**

A Micron or Torr gauge must be used for this procedure.

1. Discharge the oxygen-free nitrogen and evacuate the system to a reading of 8000 Microns (8 Torr) using all service valves.
2. Break the vacuum by allowing nitrogen into the three inter-connecting pipework port connections (low pressure gas pipe, high pressure gas pipe and liquid line pipe) until a positive pressure is achieved.
3. Evacuate the system to a reading of 5000 Microns (5 Torr).
4. Break the vacuum by allowing nitrogen into the three inter-connecting pipework port connections (low pressure gas pipe, high pressure gas pipe and liquid line pipe) until a positive pressure is achieved.
5. Evacuate the system to a minimum reading of 500 Microns (0.5 Torr).
6. For a moisture free system, ensure the vacuum is held without movement for a minimum of 4 hours.
7. If pressure loss is detected, carry out steps 2 through 6 until no pressure loss is observed.

---

**IMPORTANT**

Use only oxygen-free nitrogen (OFN).
Additional Refrigerant Charge

When refrigerant piping connections have been completed, it will be necessary to adjust the system refrigerant charge based on the diameter and length of the liquid line pipe between the outdoor and indoor unit(s).

Table 4 lists the refrigerant piping sizes along with the refrigerant adjustment required per foot of liquid line pipe.

This system is suitable for use with R-410A refrigerant only.

Liquid Line Length Calculation

Calculate additional refrigerant charge using the diameter and length of the liquid pipe.

<table>
<thead>
<tr>
<th>Liquid Line Pipe Size</th>
<th>Additional Refrigerant Per Foot of Pipe Length</th>
</tr>
</thead>
<tbody>

<td>0.040 lb.</td>
</tr>
<tr>
<td>1/2 in.</td>
<td>0.080 lb.</td>
</tr>
<tr>
<td>5/8 in.</td>
<td>0.120 lb.</td>
</tr>
<tr>
<td>3/4 in.</td>
<td>0.181 lb.</td>
</tr>
<tr>
<td>7/8 in.</td>
<td>0.255 lb.</td>
</tr>
</tbody>
</table>

Branch Pipe Kit Calculation

Add 1.60 ft. (488 mm) per EACH liquid line branch pipe (incoming pipe size only) for additional charge calculation.

Example: The branch pipe kit has an incoming pipe size of 7/8" and outgoing pipe sizes of 3/8" and 5/8". Use only the incoming pipe size of 7/8" to calculate the additional refrigerant charge for this branch pipe kit.

Wiring Connections

**WARNING**

Isolate the power supply before accessing unit electrical terminals.

Install unit so that unit disconnect is accessible.

Follow all local and national codes, as well as this installation instruction, during installation. Do NOT overload electrical circuit, as this may lead to failure and possible fire.

Use specified wiring and cable to make electrical connections. Clamp cables securely and make sure that connections are tight to avoid strain on wiring. Insecure wiring connections may result in equipment failure and risk of fire.

Wiring must be installed so that all cover plates can be securely closed.

Do not attempt to repair a damaged power cord.

Do not modify the power cord in any way. Do not attempt to extend the length of the power cord or use an extension cord with this appliance. Do not share the single power outlet with any other appliances.

In the U.S.A., wiring must conform with current local codes and the current National Electric Code (NEC).

In Canada, wiring must conform with current local codes and the current Canadian Electrical Code (CEC).

Refer to unit nameplate for minimum circuit ampacity and maximum overcurrent protection size.

**NOTE** - Three-conductor, stranded, shielded cable must be used for the communication wiring. This is necessary to ensure proper system communication and operation.

**NOTE** - The outdoor unit requires a separate circuit breaker and power supply.

1. Select the appropriate electrical inlet into the outdoor unit. Local and national codes apply.

2. Locate the terminal strip in the outdoor unit control box. Connect the power wiring (sized per NEC/CEC and local codes) and communications cable (3-conductor, shielded cable) per Figure 22. Refer to unit nameplate for rated voltage.

**CAUTION**

This unit must be properly grounded and protected by a circuit breaker. The ground wire for the unit must not be connected to a gas or water pipe, a lightning conductor or a telephone ground wire.

Do not connect power wires to the outdoor unit until all other wiring and piping connections have been completed.

Install all wiring at least 3 feet away from televisions, radios or other electronic devices in order to avoid the possibility of interference with the unit operation.

Do not install the unit near a lighting appliance that includes a ballast. The ballast may affect remote control operation.

Separate power wiring supplies must be provided for the outdoor unit and indoor unit(s).

Do not cross-connect refrigerant piping or signal wires between VRF systems. Each VRF system must be piped and wired separately.

Each indoor unit must have its own electrical disconnect.

Do not run signal wire and power wire in the same conduit; keep distance between the two conduits per local codes. (Make sure to set address of outdoor unit in case of parallel multi-outdoor units.

Take care when making final power and control cable connections. Cross connection will result in damage to unit’s main board.

Only apply power to the system after performing all of the pre-commissioning steps.

**IMPORTANT**

DO NOT adjust DIP switch settings. Settings may only be adjusted by a trained technician as part of the commissioning procedures.

**NOTE** - Use 18 GA 3-Conductor, Stranded, Shielded Communication Cable

Figure 29. Typical Communication Wiring

Network Address and Commissioning
After the system has been installed, the outdoor unit will automatically assign addresses to all connected indoor units. These addresses may be modified using an optional remote control as part of the commissioning procedure.

DIP switch 1 on SW-4 on the outdoor unit main control is factory-set to ON.
