Supersedes 06/2020

THIS MANUAL MUST BE LEFT WITH THE
HOMEOWNER FOR FUTURE REFERENCE

⚠️ WARNING
Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a licensed professional HVAC installer or equivalent, service agency, or the gas supplier.

This is a safety alert symbol and should never be ignored. When you see this symbol on labels or in manuals, be alert to the potential for personal injury or death.

⚠️ CAUTION
As with any mechanical equipment, contact with sharp sheet metal edges can result in personal injury. Take care while handling this equipment and wear gloves and protective clothing.

⚠️ NOTICE
A thermostat is not included and must be ordered separately.
- A communicating thermostat must be used in communicating applications.
- In non-communicating applications, the Lennox ComfortSense® 7500 thermostat may be used, as well as other non-communicating thermostats.

In all cases, setup is critical to ensure proper system operation.
Field wiring for both communicating and non-communicating applications is illustrated in diagrams, which begin on Page 35

Unit Dimensions - inches (mm)

1 NOTE - 60C and 60D size units that require air volumes over 1800 cfm must have one of the following:
1. Single side return air and Optional Return Air Base with transition that must accommodate required 20 x 25 x 1 inch (508 x 635 x 25 mm) air filter to maintain proper velocity.
2. Bottom return air.
3. Return air from both sides.
4. Bottom and one side return air.
See Blower Performance Tables for additional information.

2 Optional Side Return Air Filter Kit is not for use with the Optional Return Air Base.

Flue Condensate Trap Assembly
Furnished for external field installation on either side of unit. (See installation instructions for additional information.)

SLP99UHV Gas Furnace

The SLP99UHV category IV gas furnace is equipped with a variable-capacity, variable-speed integrated control. This control ensures compatibility with a communicating thermostat, the iHarmony® zone control system, or a thermostat which provides humidity control. Each SLP99UHV is shipped ready for installation in the upflow, horizontal left air discharge or horizontal right air discharge position. The furnace is equipped for natural gas applications only. A changeover kit may be ordered for LP applications.

The SLP99UHV must be installed only as a Direct Vent gas furnace.

NOTE - In Direct Vent installations, combustion air is taken from outdoors and flue gases are discharged outdoors. See FIGURE 2 for applications including roof termination.

**Shipping and Packing List**

**Package 1 of 1 contains**

1 - Assembled SLP99UHV unit
1 - Bag assembly containing the following:
   1 - Snap bushing
   1 - Snap plug
   1 - Wire tie
   1 - Condensate trap
   1 - Condensate trap cap
   1 - Condensate trap cap clamp
   1 - 3/4" Threaded street elbow
   1 - Flue Coupling
1 - Bag containing discharge air sensor

Check equipment for shipping damage. If you find any damage, immediately contact the last carrier.

The following items may also be ordered separately:

1 - Thermostat
1 - Natural to LP gas conversion kit
1 - High altitude kit
1 - Horizontal suspension kit

**DANGER**

Danger of explosion.

There are circumstances in which odorant used with LP/propane gas can lose its scent. In case of a leak, LP/propane gas will settle close to the floor and may be difficult to smell. An LP/propane leak detector should be installed in all LP applications.

**Safety Information**

**WARNING**

Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a licensed professional installer (or equivalent), service agency or the gas supplier.

**CAUTION**

As with any mechanical equipment, contact with sharp sheet metal edges can result in personal injury. Take care while handling this equipment and wear gloves and protective clothing.

Use only the type of gas approved for use with this furnace. Refer to unit nameplate.

**Building Codes**

In the USA, installation of gas furnaces must conform with local building codes. In the absence of local codes, units must be installed according to the current National Fuel Gas Code (ANSI-Z223.1/NFPA 54). The National Fuel Gas Code is available from the following address:

American National Standards Institute, Inc.
11 West 42nd Street
New York, NY 10036

**Installed Locations**

In Canada, installation must conform with current National Standard of Canada CSA-B149 Natural Gas and Propane Installation Codes, local plumbing or waste water codes and other applicable local codes.

This furnace is designed for installation clearances to combustible material as listed on the unit nameplate and in the tables in FIGURE 10 and FIGURE 11. Accessibility and service clearances must take precedence over fire protection clearances.

**NOTE - For installation on combustible floors, the furnace shall not be installed directly on carpeting, tile, or other combustible material other than wood flooring.**

For installation in a residential garage, the furnace must be installed so that the burner(s) and the ignition source are located no less than 18 inches (457 mm) above the floor. The furnace must be located or protected to avoid physical damage by vehicles. When a furnace is installed
in a public garage, hangar, or other building that has a hazardous atmosphere, the furnace must be installed according to recommended good practice requirements and current National Fuel Gas Code or CSA B149 standard.

**NOTE** - Furnace must be adjusted to obtain a temperature rise (100% percent capacity) within the range(s) specified on the unit nameplate. Failure to do so may cause erratic limit operation and may also result in premature heat exchanger failure. See “Duct System” on page 10 for installing the optional discharge air sensor used to measure temperature rise. Sensor is shipped with the unit.

This SLP99UHV furnace must be installed so that its electrical components are protected from water.

**Installed in Combination with a Cooling Coil**

When this furnace is used with cooling units, it shall be installed in parallel with, or on the upstream side of, cooling units to avoid condensation in the heating compartment. With a parallel flow arrangement, a damper (or other means to control the flow of air) must adequately prevent chilled air from entering the furnace. If the damper is manually operated, it must be equipped to prevent operation of either the heating or the cooling unit, unless it is in the full HEAT or COOL setting. See FIGURE 3.

The SLP99UHV furnace may be installed in alcoves, closets, attics, basements, garages, and utility rooms. This furnace is not designed for installation in mobile homes, recreational vehicles, or outdoors.

Never use an open flame to test for gas leaks. Check all connections using a commercially available soap solution made specifically for leak detection.

**Use of Furnace as Construction Heater**

Units may be used for heating of buildings or structures under construction, if the following conditions are met to ensure proper operation:

**DO NOT USE THE UNIT FOR CONSTRUCTION HEAT UNLESS ALL OF THE FOLLOWING CRITERIA ARE MET:**

- Furnace must be in its final location. The vent system must be permanently installed per these installation instructions.
- Furnace must be installed as a two pipe system and one hundred percent (100%) outdoor air must be provided for combustion air requirements during construction.
- A room thermostat must control the furnace. The use of fixed jumpers that will provide continuous heating is prohibited.
- The input rate and temperature rise must be set per the furnace rating plate.
- Supply and Return air ducts must be provided and sealed to the furnace. Return air must be terminated outside of the space where furnace is installed.
- Return air temperature range between 60°F (16°C) and 80°F (27°C) must be maintained.
- MERV 11 or greater air filters must be installed in the system and must be regularly inspected and maintained (e.g., regular static checks and replaced at end of life) during construction.
- Blower and vestibule access panels must be in place on the furnace at all times.
- The furnace heat exchanger, components, duct system, and evaporator coils must be thoroughly cleaned following final construction clean-up.

**NOTE** - This furnace is designed for a minimum continuous return air temperature of 60°F (16°C) or an intermittent operation down to 55°F (13°C) dry bulb for cases where a night setback thermostat is used. Return air temperature must not exceed 85°F (29°C) dry bulb.

In Canada, all electrical wiring and grounding for the unit must be installed according to the current regulations of the Canadian Electrical Code Part I (CSA Standard C22.1) and/or local codes.

---

**CAUTION**

Do not set thermostat below 60°F (16°C) in heating mode. Setting below 60°F (16°C) reduces the number of heating cycles. Damage to the unit may occur that is not covered by the warranty.

The SLP99UHV furnace may be installed in alcoves, closets, attics, basements, garages, and utility rooms.
• Air filters must be replaced upon construction completion.
• All furnace operating conditions (including ignition, input rate, temperature rise and venting) must be verified in accordance with these installation instructions.

EQUIPMENT MAY EXPERIENCE PREMATURE COMPONENT FAILURE AS A RESULT OF FAILURE TO FOLLOW THE ABOVE INSTALLATION INSTRUCTIONS. FAILURE TO FOLLOW THE ABOVE INSTALLATION INSTRUCTIONS voids the manufacturer’s equipment limited warranty. Lennox disclaims all liability in connection with installer’s failure to follow the above installation instructions.

NOTWITHSTANDING THE FOREGOING, INSTALLER IS RESPONSIBLE FOR CONFIRMING THAT THE USE OF CONSTRUCTION HEAT IS CONSISTENT WITH THE POLICIES AND CODES OF ALL REGULATING ENTITIES. ALL SUCH POLICIES AND CODES MUST BE ADHERED TO.

General

CAUTION
SLP99UHV unit should not be installed in areas normally subject to freezing temperatures.

These instructions are intended as a general guide and do not supersede local codes in any way. Consult authorities having jurisdiction before installation.

In addition to the requirements outlined previously, the following general recommendations must be considered when installing a SLP99UHV furnace:
• Place the furnace as close to the center of the air distribution system as possible. The furnace should also be located close to the chimney or vent termination point
• When the furnace is installed in an attic or other insulated space, keep insulation away from the furnace.
• When the furnace is installed in an unconditioned space, consider provisions required to prevent freezing of condensate drain system.
• Please consult the manufacturer of your evaporator coil for their recommendations on distance required between the heat exchanger and their drain pan. Adequate space must be provided between the drain pan and the furnace heat exchanger.

Installation - Setting Equipment

WARNING
Do not connect the return air ducts to the back of the furnace. Doing so will adversely affect the operation of the safety control devices, which could result in personal injury or death.

WARNING
Do not install the furnace on its front or back. See FIGURE 4.

FIGURE 4

Upflow Applications

The SLP99UHV gas furnace can be installed as shipped in the upflow position. Refer to figure 10 for clearances. Select a location that allows for the required clearances that are listed on the unit nameplate. Also consider gas supply connections, electrical supply, vent connection, condensate trap and drain connections, and installation and service clearances [24 inches (610 mm) at unit front]. The unit must be level from side to side. Unit may be positioned from level to 1/2” toward the front to aid in draining. See FIGURE 5.
Unit must be level side-to-side. Unit may be positioned from level to 1/2" toward the front to aid in draining.

**FIGURE 5**

**Side Return Air**
(with transition and filter)

<table>
<thead>
<tr>
<th>Transition</th>
<th>Return Air Plenum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Air Filter</td>
<td>20&quot; X 25&quot; X 1&quot; (508mmX635mmX25mm)</td>
</tr>
</tbody>
</table>

SLP99UHV applications which include side return air and a condensate trap installed on the same side of the cabinet (trap can be installed remotely within 5 feet) require either a return air base or field-fabricated transition to accommodate an optional IAQ accessory taller than 14.5”. See **FIGURE 6**.

**FIGURE 6**

Removing the Bottom Panel

Remove the two screws that secure the bottom cap to the furnace. Pivot the bottom cap down to release the bottom panel. Once the bottom panel has been removed, reinstall the bottom cap. See **FIGURE 7**.

**Removing the Bottom Panel**

| Bottom Cap | Screw | Bottom Panel |

**FIGURE 7**
NOTE - Optional side return air filter kits are not for use with return air base.
1 Both the unit return air opening and the base return air opening must be covered by a single plenum or IAQ cabinet.
Minimum unit side return air opening dimensions for units requiring 1800 cfm or more of air (W x H): 23 x 11 in. (584 x 279 mm).
The opening can be cut as needed to accommodate plenum or IAQ cabinet while maintaining dimensions shown.
Side return air openings must be cut in the field. There are cutting guides stenciled on the cabinet for the side return air
opening. The size of the opening must not extend beyond the markings on the furnace cabinet.
2 To minimize pressure drop, the largest opening height possible (up to 14 inches) is preferred.

NOTE - Units with 1/2 hp blower motor are equipped with three flexible legs and one rigid leg. The rigid leg is
equipped with a shipping bolt and a flat white plastic washer (rather than the rubber mounting grommet used with
a flexible mounting leg). See FIGURE 9. The bolt and washer must be removed before the furnace is placed
into operation. After the bolt and washer have been removed, the rigid leg will not touch the blower housing.

Allow for clearances to combustible materials as indicated on the unit nameplate. Minimum clearances for closet or
alcove installations are shown in FIGURE 10 and FIGURE 11.

WARNING
The blower door must be securely in place when the blower and burners are operating. Gas fumes, which
could contain carbon monoxide, can be drawn into the living space resulting in personal injury or death.

WARNING
Improper installation of the furnace can result in personal injury or death. Combustion and flue products must
never be allowed to enter the return air system or air in the living space. Use sheet metal screws and joint tape
to seal return air system to furnace.
In platform installations with furnace return, the furnace should be sealed airtight to the return air plenum. A door
must never be used as a portion of the return air duct system. The base must provide a stable support and an
airtight seal to the furnace. Allow absolutely no sagging, cracks, gaps, etc. For no reason should return and
supply air duct systems ever be connected to or from other heating devices such as a fireplace or stove, etc.
Fire, explosion, carbon monoxide poisoning, personal injury and/or property damage could result.
Return Air -- Upflow Units

Return air can be brought in through the bottom or either side of the furnace installed in an upflow application. If the furnace is installed on a platform with bottom return, make an airtight seal between the bottom of the furnace and the platform to ensure that the furnace operates properly and safely. The furnace is equipped with a removable bottom panel to facilitate installation.

Markings are provided on both sides of the furnace cabinet for installations that require side return air. Cut the furnace cabinet at the maximum dimensions shown on page 2. Refer to Engineering Handbook for additional information.

Setting an Upflow Unit

When the side return air inlets are used in an upflow application, it may be necessary to install shims on the bottom of the furnace.

Horizontal Applications

The SLP99UHV furnace can be installed in horizontal applications with either right- or left-hand air discharge. Refer to FIGURE 11 for clearances in horizontal applications.

FIGURE 10

Return Air -- Upflow Units

Return air can be brought in through the bottom or either side of the furnace installed in an upflow application. If the furnace is installed on a platform with bottom return, make an airtight seal between the bottom of the furnace and the platform to ensure that the furnace operates properly and safely. The furnace is equipped with a removable bottom panel to facilitate installation.

Markings are provided on both sides of the furnace cabinet for installations that require side return air. Cut the furnace cabinet at the maximum dimensions shown on page 2. Refer to Engineering Handbook for additional information.

Setting an Upflow Unit

When the side return air inlets are used in an upflow application, it may be necessary to install shims on the bottom of the furnace.

Horizontal Applications

The SLP99UHV furnace can be installed in horizontal applications with either right- or left-hand air discharge. Refer to FIGURE 11 for clearances in horizontal applications.
**NOTE** - When the furnace is installed on a platform in a crawlspace, it must be elevated enough to avoid water damage and to allow the evaporator coil to drain.

**HORIZONTAL SUSPENSION KIT**

- Metal Strap (typical)
- Bracket (typical)
- Internal Brace (provided with kit)

**FIGURE 12**

Platform Installation of Horizontal Unit

1. Select location for unit keeping in mind service and other necessary clearances. See FIGURE 11.

2. Construct a raised wooden frame and cover frame with a plywood sheet. If unit is installed above finished space, fabricate an auxiliary drain pan to be installed under unit. Set unit in drain pan as shown in FIGURE 13. Leave 8 inches for service clearance below unit for condensate trap.

3. Provide a service platform in front of unit. When installing the unit in a crawl space, a proper support platform may be created using cement blocks.

4. Route auxiliary drain line so that water draining from this outlet will be easily noticed by the homeowner.

5. If necessary, run the condensate line into a condensate pump to meet drain line slope requirements. The pump must be rated for use with condensing furnaces. Protect the condensate discharge line from the pump to the outside to avoid freezing.

6. Continue with exhaust, condensate and intake piping installation according to instructions.

**FIGURE 13**

Return Air -- Horizontal Applications

Return air must be brought in through the end of a furnace installed in the horizontal position. The furnace is equipped with a removable bottom panel to facilitate installation. See FIGURE 7.

**Filters**

This unit is not equipped with a filter or rack. A field-provided filter is required for the unit to operate properly. TABLE 1 lists recommended filter sizes.

**IMPORTANT**

If a high efficiency filter is being installed as part of this system to ensure better indoor air quality, the filter must be properly sized. High efficiency filters have a higher static pressure drop than standard efficiency glass/foam filters. If the pressure drop is too great, system capacity and performance may be reduced. The pressure drop may also cause the limit to trip more frequently during the winter and the indoor coil to freeze in the summer, resulting in an increase in the number of service calls.

Before using any filter with this system, check the specifications provided by the filter manufacturer against the data given in the appropriate Lennox Product Specifications bulletin. Additional Information is provided in Service and Application Note ACC002 (August 2000).

A filter must be in place when the unit is operating.

**NOTE** - In upflow applications where side return air filter is installed on same side as the condensate trap, make sure that clearance is maintained to ensure future access to the filter access panel.

**Duct System**

Use industry-approved standards to size and install the supply and return air duct system. This will result in a quiet and low-static system that has uniform air distribution. See below for proper duct installation.
Discharge Air Temperature Sensor

This furnace is shipped with a discharge air temperature sensor that can be installed in the supply air plenum. The sensor is used to measure temperature rise in the heating mode and temperature drop in the cooling mode. See TABLE 2 and FIGURE 15 (upflow) or TABLE 3 and FIGURE 16 (horizontal left) or TABLE 4 and FIGURE 17 (horizontal right) for correct location. Drill a 3/8 inch diameter hole in the supply duct based on the specified location. Center the discharge air temperature sensor in the middle of the hole and use two field provided screws to secure in place. The orientation of the sensor mounting flange is not critical and can be oriented to whatever position is needed to prevent interference with the evaporator coil, air duct etc. Field supplied wiring must be used to connect the discharge air temperature sensor to the discharge air temperature sensor terminals on the integrated control board. Either wire can be connected to either terminal. See FIGURE 18.

A communicating thermostat can be used to run temperature rise and temperature drop tests and viewed in the installation reports. See “FIGURE 53” on page 36 for communicating thermostat wiring. If a communicating thermostat is not being used, then the discharge temperature can be viewed on the seven segment LED on the integrated control shown in FIGURE 18.

For zoning applications the discharge air sensor must be installed and wired to the zoning control board and should not be wired to the furnace control board.

**NOTE** - The discharge air temperature sensor must be located per TABLE 2, TABLE 3 or TABLE 4 to provide an accurate temperature measurement.

### FIGURE 16
Discharge Air Temperature Sensor Location

### FIGURE 17
Discharge Air Temperature Sensor Location

### FIGURE 18
Discharge Air Temperature Sensor Field Wiring
NOTE - Operation of this furnace in heating mode (indoor blower operating at selected heating speed) with an external static pressure which exceeds 0.8 inches w.c. may result in erratic limit operation.

Supply Air Plenum

If the furnace is installed without a cooling coil, a removable access panel should be installed in the supply air duct. The access panel should be large enough to permit inspection (by reflected light) of the heat exchanger for leaks after the furnace is installed. If present, this access panel must always be in place when the furnace is operating and it must not allow leaks into the supply air duct system. In horizontal units, install self tapping screws in the three evaporator coil screw holes made for upflow applications to seal the top cap to the vestibule panel.

Return Air Plenum

Return air must not be drawn from a room where this furnace, or any other gas-fueled appliance (i.e., water heater), or carbon monoxide-producing device (i.e., wood fireplace) is installed. When return air is drawn from a room, a negative pressure is created in the room. If a gas appliance is operating in a room with negative pressure, the flue products can be pulled back down the vent pipe and into the room. This reverse flow of the flue gas may result in incomplete combustion and the formation of carbon monoxide gas. This toxic gas might then be distributed throughout the house by the furnace duct system.

Return air can be brought in through the bottom or either side of the furnace (return air brought in through either side of the furnace allowed in upflow applications only). If a furnace with bottom return air is installed on a platform, make an airtight seal between the bottom of the furnace and the platform to ensure that the unit operates properly and safely. Use fiberglass sealing strips, caulking, or equivalent sealing method between the plenum and the furnace cabinet to ensure a tight seal. If a filter is installed, size the return air duct to fit the filter frame.

Pipe Fittings Specifications

All pipe, fittings, primer and solvent cement must conform with American National Standard Institute and the American Society for Testing and Materials (ANSI/ASTM) standards. The solvent shall be free-flowing and contain no lumps, undissolved particles or any foreign matter that adversely affects the joint strength or chemical resistance of the cement. The cement shall show no gelation, stratification, or separation that cannot be removed by stirring. Refer to TABLE 5 for approved piping and fitting materials.

**CAUTION**

Solvent cements for plastic pipe are flammable liquids and should be kept away from all sources of ignition. Do not use excessive amounts of solvent cement when making joints. Good ventilation should be maintained to reduce fire hazard and to minimize breathing of solvent vapors. Avoid contact of cement with skin and eyes.

**IMPORTANT**

SLP99UHV exhaust and intake connections are made of PVC. Use PVC primer and solvent cement when using PVC vent pipe. When using ABS vent pipe, use transitional solvent cement to make connections to the PVC fittings in the unit.
Use PVC primer and solvent cement or ABS solvent cement meeting ASTM specifications, refer to TABLE 5. As an alternate, use all purpose cement, to bond ABS, PVC, or CPVC pipe when using fittings and pipe made of the same materials. Use transition solvent cement when bonding ABS to either PVC or CPVC. Low temperature solvent cement is recommended. Metal or plastic strapping may be used for vent pipe hangers. Uniformly apply a liberal coat of PVC primer for PVC.

**NOTE** - Standard Terminations do not include any vent pipe or elbows external to the structure. Any vent pipe or elbows external to the structure must be included in total vent length calculations. See vent length tables.

1. Kits must be properly installed according to kit instructions.
2. Requires field-provided outdoor 1-1/2” exhaust accelerator.
3. Concentric kits 71M80 and 44W92 include 1-1/2 in. outdoor accelerator, when used with 070 input models. When 1-1/2 in. pipe is used it must transition to 2 in. pipe with the concentric kit.
4. Flush mount kits 51W11 and 51W12 include 1-1/2 in. outdoor exhaust accelerator, required when used with 070 and 090 input models. When 1-1/2 in. pipe is used it must transition to 2 in. pipe with the flush mount kit.
5. Termination kits 30G28, 44W92, 4493 and 81J20 are certified to ULC S636 for use in Canada only.
6. See table 7 for vent accelerator requirements.

### Joint Cementing Procedure

All cementing of joints should be done according to the specifications outlined in ASTM D 2855.

**NOTE** - A sheet metal screw may be used to secure the intake pipe to the connector, if desired. Use a drill or self tapping screw to make a pilot hole.

**DANGER**

Fumes from PVC glue may ignite during system check. Allow fumes to dissipate for at least 5 minutes before placing unit into operation.

1. Measure and cut vent pipe to desired length.
2. Debur and chamfer end of pipe, removing any ridges or rough edges. If end is not chamfered, edge of pipe may remove cement from fitting socket and result in a leaking joint.

**NOTE** - Check the inside of vent pipe thoroughly for any obstruction that may alter furnace operation.
3. Clean and dry surfaces to be joined.
4. Test fit joint and mark depth of fitting on outside of pipe.
5. Uniformly apply a liberal coat of PVC primer for PVC or use a clean dry cloth for ABS to clean inside socket surface of fitting and male end of pipe to depth of fitting socket.
6. Promptly apply solvent cement to end of pipe and inside socket surface of fitting. Cement should be applied lightly but uniformly to inside of socket. Take care to keep excess cement out of socket. Apply second coat to end of pipe.

**NOTE** - Time is critical at this stage. Do not allow primer to dry before applying cement.
7 - Immediately after applying last coat of cement to pipe, and while both inside socket surface and end of pipe are wet with cement, forcefully insert end of pipe into socket until it bottoms out. Turn PVC pipe 1/4 turn during assembly (but not after pipe is fully inserted) to distribute cement evenly. DO NOT turn ABS or cellular core pipe.

**NOTE** - Assembly should be completed within 20 seconds after last application of cement. Hammer blows should not be used when inserting pipe.

8 - After assembly, wipe excess cement from pipe at end of fitting socket. A properly made joint will show a bead around its entire perimeter. Any gaps may indicate a defective assembly due to insufficient solvent.

9 - Handle joints carefully until completely set.

---

### Venting Practices

**Piping Suspension Guidelines**

<table>
<thead>
<tr>
<th>SCHEDULE 40</th>
<th>PVC - 5'</th>
</tr>
</thead>
<tbody>
<tr>
<td>all other pipe*</td>
<td>- 3'</td>
</tr>
</tbody>
</table>

* See Piping and Fittings Specifications table

**NOTE** - Isolate piping at the point where it exits the outside wall or roof in order to prevent transmission of vibration to the structure.

**Wall Thickness Guidelines**

- 24" maximum
- 3/4" minimum

---

**FIGURE 19**

1 - In areas where piping penetrates joists or interior walls, hole must be large enough to allow clearance on all sides of pipe through center of hole using a hanger.

2 - When furnace is installed in a residence where unit is shut down for an extended period of time, such as a vacation home, make provisions for draining condensate collection trap and lines.

**Exhaust Piping** [FIGURE 23, FIGURE 24 and FIGURE 26 (vent adapter)]

3 - Route piping to outside of structure. Continue with installation following instructions given in piping termination section.

**Intake Piping** [FIGURE 23 and FIGURE 24]

The SLP99UHV furnace may be installed only in direct vent applications.

The SLP99UHV is designed for combustion air intake through an inlet in the unit’s top cap. Intake air piping is independent of exhaust piping.
The SLP99UHV is installed only as a Direct Vent gas central furnace.

NOTE - In Direct Vent installations, combustion air is taken from outdoors and flue gases are discharged outdoors. Intake and exhaust pipe sizing – Size pipe according to TABLE 7 and TABLE 8. Count all elbows inside and outside the home.

Regardless of the diameter of pipe used, the standard roof and wall terminations described in section Exhaust Piping Terminations should be used. Exhaust vent termination pipe is sized to optimize the velocity of the exhaust gas as it exits the termination. Refer to TABLE 10.

In some applications which permit the use of several different sizes of vent pipe, a combination vent pipe may be used. Contact Lennox’ Application Department for assistance in sizing vent pipe in these applications.

Use the steps in FIGURE 22 to correctly size vent pipe diameter.

NOTE - It is acceptable to use any pipe size which fits within the guidelines allowed in TABLE 8.

FIGURE 21

Horizontal Installation Offset Requirements

NOTE - All horizontal runs of exhaust pipe must slope back toward unit. A minimum of 1/4” (8mm) drop for each 12” (305mm) of horizontal run is mandatory for drainage.

NOTE - Exhaust pipe MUST be glued to furnace exhaust fitting.

NOTE - Exhaust piping should be checked carefully to make sure there are no sags or low spots.

FIGURE 22

Piping Size Process

1. What is the furnace capacity?
2. Which style termination being used? Standard or concentric?
3. Which needs most elbows? Intake or exhaust?
5. Desired pipe size?
6. What is the altitude of the furnace installation?
7. Find max intake or exhaust pipe length. Includes all vent pipe and elbows inside and outside the house.

TABLE 7

<table>
<thead>
<tr>
<th>MODEL</th>
<th>MIN.EQUIV. VENT LENGTH</th>
<th>EXAMPLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>070</td>
<td>15 ft*</td>
<td>5 ft. plus 2 elbows of 1-1/2”, 2”, 2-1/2” or 3” diameter pipe</td>
</tr>
<tr>
<td>090, 110</td>
<td>15 ft*</td>
<td>5 ft. plus 2 elbows of 2”, 2-1/2” or 3” diameter pipe</td>
</tr>
<tr>
<td>135</td>
<td>15 ft*</td>
<td>5 ft. plus 2 elbows of 3” diameter pipe</td>
</tr>
</tbody>
</table>

*Any approved termination may be added to the minimum equivalent length listed. Two 45 degree elbows are the equivalent to one 90 degree elbow.

NOTE - The exhaust collar on all models is sized to accommodate 2” Schedule 40 vent pipe. In horizontal applications, any transition to exhaust pipe larger than 2” must be made in vertical runs of the pipe. Therefore a 2” elbow must be added before the pipe is transitioned to any size larger than 2”. This elbow must be added to the elbow count used to determine acceptable vent lengths. Contact the Application Department for more information concerning sizing of vent systems which include multiple pipe sizes.

NOTE - Lennox offers a glueless vent adapter kit 17H92 as an option for exhaust exiting at the furnace top cap coupling. If the kit is not used then the exhaust pipe MUST be glued to the furnace exhaust fitting.

IMPORTANT

Do not use screens or perforated metal in exhaust or intake terminations. Doing so will cause freeze-ups and may block the terminations.
### TABLE 8

Maximum Allowable Intake or Exhaust Vent Length in Feet

*Size intake and exhaust pipe length separately. Values in table are for Intake OR Exhaust, not combined total. Both Intake and Exhaust must be same pipe size. NOTE - Additional vent pipe and elbows used to terminate the vent pipe outside the structure must be included in the total vent length calculation.*

</table>

¹ In accordance with the current ANSI Z223.1/NFPA 54 Natural Fuel Gas Code  
² In accordance with the current CSA B149.1, Natural Gas and Propane Installation Code  
† A vent shall not terminate directly above a sidewalk or paved driveway that is located between two single family dwellings and serves both dwellings.  
‡ Permitted only if veranda, porch, deck or balcony is fully open on a minimum of two sides beneath the floor. Lennox recommends avoiding this location if possible.  

*For clearances not specified in ANSI Z223.1/NFPA 54 or CSA B149.1, clearance will be in accordance with local installation codes and the requirements of the gas supplier and these installation instructions.*
Flue Coupling

The provided flue coupling must be attached to the exhaust coupling on the furnace top panel. Use provided bands. See steps below. and FIGURE 26.

1 - Remove the caution tag from the flue coupling.
2 - Fully insert flue coupling with both bands loosely attached on the furnace exhaust coupling.
3 - Insert PVC exhaust pipe through flue coupling. Ensure vent pipe is fully seated into exhaust coupling.
4 - Tighten both top and bottom bands to 40in-lbs.

**NOTE** - Do not use any type of glue or silicone to attach the flue coupling to the furnace exhaust coupling.

---

Crawl Space and Extended Horizontal Venting

Lennox provides kit 51W18(USA) and kit 15Z70 (Canada) to install 2" or 3" PVC exhaust piping through the floor joists and into the the crawl space. This kit can also be used as a supplemental drain for installations with condensate run back in the vent pipe (ie. long horizontal runs, unconditioned spaces, etc.). See FIGURE 27 and FIGURE 28.

---

**Guidelines for Vent Terminations**

In Direct Vent applications, combustion air is taken from outdoors and the flue gases are discharged to the outdoors. The SLP99UHV is classified as a direct vent, Category IV gas furnace.

In Direct Vent applications, the vent termination is limited by local building codes. In the absence of local codes, refer to the current National Fuel Gas Code ANSI Z223-1/NFPA 54 in U.S.A., and current CSA-B149 Natural Gas and Propane Installation Codes in Canada for details.

Position termination according to location given in figure 20. In addition, position termination so it is free from any obstructions and 12” above the average snow accumulation.

At vent termination, care must be taken to maintain protective coatings over building materials (prolonged exposure to exhaust condensate can destroy protective coatings). It is recommended that the exhaust outlet not be located within 6 feet (1.8m) of an outdoor AC unit because the condensate can damage the painted coating.

**NOTE** - See TABLE 9 for maximum allowed exhaust pipe length without insulation in unconditioned space during winter design temperatures below 32°F (0°C). If required, exhaust pipe should be insulated with 1/2" (13mm) Armadex or equivalent. In extreme cold climate areas, 3/4” (19mm) Armadex or equivalent may be necessary. Insulation must be protected from deterioration. Armaflex with UV protection is permissible. Basements or other enclosed areas that are not exposed to the outdoor ambient temperature and are above 32 degrees F (0°C) are to be considered conditioned spaces.

---

**IMPORTANT**

Do not use screens or perforated metal in exhaust or intake terminations. Doing so will cause freeze-ups and may block the terminations.

---

**IMPORTANT**

For Canadian Installations Only:
In accordance to CSA International B149 installation codes, the minimum allowed distance between the combustion air intake inlet and the exhaust outlet of other appliances shall not be less than 12 inches (305mm).

1Refer to 99% Minimum Design Temperature table provided in the current edition of the ASHRAE Fundamentals Handbook.

2 Poly-Propylene vent pipe (PP) by Duravent and Centrotherm.

3 Vent lengths in table are equivalent length. Consider each elbow as 5ft of linear length.

NOTE - Concentric terminations are the equivalent of 5’ and should be considered when measuring pipe length.

NOTE - Maximum uninsulated vent lengths listed may include the termination(vent pipe exterior to the structure) and cannot exceed 5 linear feet or the maximum allowable intake or exhaust vent length listed in table 5 or which ever is less.

NOTE - If insulation is required in an unconditioned space, it must be located on the pipe closest to the furnace. See FIGURE 29.

---

**FIGURE 29**

Diagram showing a comparison between conditioned and unconditioned spaces, with vent pipes and terminations.
Details of Intake and Exhaust Piping Terminations for Direct Vent Installations

NOTE - In Direct Vent installations, combustion air is taken from outdoors and flue gases are discharged to outdoors.

NOTE - Flue gas may be slightly acidic and may adversely affect some building materials. If any vent termination is used and the flue gases may impinge on the building material, a corrosion-resistant shield (minimum 24 inches square) should be used to protect the wall surface. If the optional tee is used, the protective shield is recommended. The shield should be constructed using wood, plastic, sheet metal or other suitable material. All seams, joints, cracks, etc. in the affected area should be sealed using an appropriate sealant. See FIGURE 37.

Intake and exhaust pipes may be routed either horizontally through an outside wall or vertically through the roof. In attic or closet installations, vertical termination through the roof is preferred. FIGURE 30 through FIGURE 38 shows typical terminations.

1 - Intake and exhaust terminations are not required to be in the same pressure zone. You may exit the intake on one side of the structure and the exhaust on another side (FIGURE 31). You may exit the exhaust out the roof and the intake out the side of the structure (FIGURE 32).

2 - Intake and exhaust pipes should be placed as close together as possible at termination end (refer to illustrations). Maximum separation is 3" (76mm) on roof terminations and 6" (152mm) on side wall terminations.

NOTE - When venting in different pressure zones, the maximum separation requirement of intake and exhaust pipe DOES NOT apply.

3 - On roof terminations, the intake piping should terminate straight down using two 90° elbows (FIGURE 30).

4 - Exhaust piping must terminate straight out or up as shown. A reducer may be required on the exhaust piping at the point where it exits the structure to improve the velocity of exhaust away from the intake piping. See TABLE 10.

NOTE - Care must be taken to avoid recirculation of exhaust back into intake pipe.

5 - On field-supplied terminations for side wall exit, exhaust piping may extend a maximum of 12 inches (305mm) for 2" PVC and 20 inches (508mm) for 3" (76mm) PVC beyond the outside wall. Intake piping should be as short as possible. See FIGURE 37.

6 - On field-supplied terminations, a minimum distance between the end of the exhaust pipe and the end of the intake pipe without a termination elbow is 8" and a minimum distance of 6" with a termination elbow. See FIGURE 37.

*SLP99UH-070 and -090 units with the flush-mount termination must use the 1-1/2" accelerator supplied with the kit.
7 - If intake and exhaust piping must be run up a side wall to position above snow accumulation or other obstructions, piping must be supported. At least one bracket must be used within 6" from the top of the elbow and then every 24" (610mm) as shown in FIGURE 37, to prevent any movement in any direction. When exhaust and intake piping must be run up an outside wall, the exhaust piping must be terminated with pipe sized per Table 7. The intake piping may be equipped with a 90° elbow turndown. Using turndown will add 5 feet (1.5m) to the equivalent length of the pipe.

8 - Based on the recommendation of the manufacturer, a multiple furnace installation may use a group of up to four terminations assembled together horizontally, as shown in FIGURE 35.
* Use wall support every 24" (610 mm). Use two wall supports if extension is greater than 24" (610 mm) but less than 48" (1219 mm).

NOTE − One wall support must be within 6" (152 mm) from top of each pipe (intake and exhaust) to prevent movement in any direction.

NOTE − FIELD−PROVIDED REDUCER MAY BE REQUIRED TO ADAPT LARGER VENT PIPE SIZE TO TERMINATION

![Diagram of venting setup](image)

</tr>
</tbody>
</table>

1 The exhaust termination tee should be connected to the 2" or 3" PVC flue pipe as shown in the illustration. Do not use an accelerator in applications that include an exhaust termination tee. The accelerator is not required.

2 As required. Flue gas may be acidic and may adversely affect some building materials. If a side wall vent termination is used and flue gases will impinge on the building materials, a corrosion−resistant shield (24 inches square) should be used to protect the wall surface. If optional tee is used, the protective shield is recommended. The shield should be constructed using wood, sheet metal or other suitable material. All seams, joints, cracks, etc. in affected area, should be sealed using an appropriate sealant.

3 Exhaust pipe 45° elbow can be rotated to the side away from the combustion air inlet to direct exhaust away from adjacent property. The exhaust must never be directed toward the combustion air inlet.

See venting table maximum venting lengths with this arrangement.

* Use wall support every 24" (610 mm). Use two wall supports if extension is greater than 24" (610 mm) but less than 48" (1219 mm).

NOTE − One wall support must be within 6" (152 mm) from top of each pipe (intake and exhaust) to prevent movement in any direction.

**FIGURE 37**
**DIRECT VENT APPLICATION USING EXISTING CHIMNEY**

Minimum 12" (305MM) above chimney top plate or average snow accumulation

**NOTE** - Do not discharge exhaust gases directly into any chimney or vent stack. If vertical discharge through an existing unused chimney or stack is required, insert piping inside chimney until the pipe open end is above top of chimney and terminate as illustrated. In any exterior portion of chimney, the exhaust vent must be insulated.

---

**FIGURE 38**

**Condensate Piping**

This unit is designed for either right- or left-side exit of condensate piping in upflow applications. In horizontal applications, the condensate trap must extend below the unit. An 8" service clearance is required for the condensate trap. Refer to FIGURE 39 and FIGURE 41 for condensate trap locations. Figure 39 shows trap assembly using 1/2" PVC or 3/4" PVC.

**NOTE** - If necessary the condensate trap may be installed up to 5' away from the furnace. Use PVC pipe to connect trap to furnace condensate outlet. Piping from furnace must slope down a minimum of 1/4" per ft. toward trap.

1 - Determine which side condensate piping will exit the unit, location of trap, field-provided fittings and length of PVC pipe required to reach available drain.

2 - Use a large flat head screw driver or a 1/2" drive socket extension and remove plug (figure 31) from the cold end header box at the appropriate location on the side of the unit. Install provided 3/4 NPT street elbow fitting into cold end header box. Use Teflon tape or appropriate pipe dope.

**NOTE** - Cold end header box drain plugs are factory installed. Check the unused plug for tightness to prevent leakage.

3 - Install the cap over the clean out opening at the base of the trap. Secure with clamp. See figure 39.

4 - Install drain trap using appropriate PVC fittings, glue all joints. Glue the provided drain trap as shown in FIGURE 47. Route the condensate line to an open drain. Condensate line must maintain a 1/4" downward slope from the furnace to the drain.

---

**FIGURE 39**

**CONSENSATE TRAP AND PLUG LOCATIONS**

(Unit shown in upflow position)

1-1/2 in.

**Plugs** (same on left side)

**NOTE** - In upflow applications where side return air filter is installed on same side as the condensate trap, filter rack must be installed beyond condensate trap or trap must be re-located to avoid interference.

---

5 - FIGURE 42 and FIGURE 44 shows the furnace and evaporator coil using a separate drain. If necessary the condensate line from the furnace and evaporator coil can drain together. See FIGURE 43, FIGURE 45 and FIGURE 46. **Upflow furnace** (FIGURE 45) - In upflow furnace applications the field provided vent must be a minimum 1" to a maximum 2" length above the condensate drain outlet connection. Any length above 2" may result in a flooded heat exchanger if the combined primary drain line were to become restricted. **Horizontal furnace** (FIGURE 46) - In horizontal furnace applications the field provided vent must be a minimum 4" to a maximum 5" length above the condensate drain outlet connection. Any length above 5" may result in a flooded heat exchanger if the combined primary drain line were to become restricted.

**NOTE** - In horizontal applications it is recommended to install a secondary drain pan underneath the unit and trap assembly.

**NOTE** - Appropriately sized tubing and barbed fitting may be used for condensate drain. Attach to the drain on the trap using a hose clamp. See FIGURE 40.
Do not use copper tubing or existing copper condensate lines for drain line.

6 - If unit will be started immediately upon completion of installation, prime trap per procedure outlined in Unit Start-Up section.

Condensate line must slope downward away from the trap to drain. If drain level is above condensate trap, condensate pump must be used. Condensate drain line should be routed within the conditioned space to avoid freezing of condensate and blockage of drain line. If this is not possible, a heat cable kit may be used on the condensate trap and line. Heating cable kit is available from Lennox in various lengths; 6 ft. (1.8m) - kit no. 26K68 and 24 ft. (7.3m) - kit no. 26K69.

*Piping from furnace must slope down a minimum 1/4" per ft. toward trap

---

**FIGURE 40**

**FIGURE 41**

**FIGURE 42**

**FIGURE 43**
**FIGURE 44**

**IMPORTANT**

When combining the furnace and evaporator coil drains together, the A/C condensate drain outlet must be vented to relieve pressure in order for the furnace pressure switch to operate properly.

FIGURE 47
Gas Piping

⚠️ CAUTION
If a flexible gas connector is required or allowed by the authority that has jurisdiction, black iron pipe shall be installed at the gas valve and extend outside the furnace cabinet. The flexible connector can then be added between the black iron pipe and the gas supply line.

⚠️ WARNING
Do not over torque (800 in-lbs) or under torque (350 in-lbs) when attaching the gas piping to the gas valve.

1 - Gas piping may be routed into the unit through either the left-or right-hand side in upflow applications, and either the top or bottom in horizontal applications. Supply piping enters into the gas valve from the side of the valve as shown in FIGURE 49 and FIGURE 50. Connect the gas supply piping into the gas valve. The maximum torque is 800 in lbs and minimum torque is 350 in lbs when attaching the gas piping to the gas valve.

2 - When connecting gas supply, factors such as length of run, number of fittings and furnace rating must be considered to avoid excessive pressure drop. TABLE 11 lists recommended pipe sizes for typical applications.

NOTE - Use two wrenches when connecting gas piping to avoid transferring torque to the manifold.

3 - Gas piping must not run in or through air ducts, clothes chutes, chimneys or gas vents, dumbwaiters or elevator shafts. Center gas line through piping hole. Gas line should not touch side of unit. See FIGURE 49 and FIGURE 50.

4 - Piping should be sloped 1/4 inch per 15 feet (6mm per 5.6m) upward toward the gas meter from the furnace. The piping must be supported at proper intervals, every 8 to 10 feet (2.44 to 3.05m), using suitable hangers or straps. Install a drip leg in vertical pipe runs to serve as a trap for sediment or condensate.

5 - A 1/8" N.P.T. plugged tap or pressure post is located on the gas valve to facilitate test gauge connection. See FIGURE 56.

6 - In some localities, codes may require installation of a manual main shut-off valve and union (furnished by installer) external to the unit. Union must be of the ground joint type.

**FIGURE 48**

Leak Check

After gas piping is completed, carefully check all piping connections (factory- and field-installed) for gas leaks. Use a leak detecting solution or other preferred means. The furnace must be isolated from the gas supply system by closing its individual manual shut-off valve during any pressure testing of the gas supply system at pressures less than or equal to 1/2 psig (3.48 kPa, 14 inches w.c.).

**IMPORTANT**
Compounds used on threaded joints of gas piping must be resistant to the actions of liquified petroleum gases.

**FIGURE 48**

When testing gas lines using pressures in excess of 1/2 psig (3.48 kPa), gas valve must be disconnected and isolated. See FIGURE 48. Gas valves can be damaged if subjected to pressures greater than 1/2 psig (3.48 kPa).

**WARNING**
Failure to follow the safety warnings exactly could result in serious injury, death, or property damage. Never use an open flame to test for gas leaks. Check all connections using a commercially available soap solution made specifically for leak detection. Some soaps used for leak detection are corrosive to certain metals. Carefully rinse piping thoroughly after leak test has been completed.
**FIGURE 49**

- **Upflow Application Left Side Piping (Standard)**

*NOTE - BLACK IRON PIPE ONLY TO BE ROUTED INSIDE OF CABINET*
Removal of the Furnace from Common Vent

In the event that an existing furnace is removed from a venting system commonly run with separate gas appliances, the venting system is likely to be too large to properly vent the remaining attached appliances. Conduct the following test while each appliance is operating and the other appliances (which are not operating) remain connected to the common venting system. If the venting system has been installed improperly, you must correct the system as indicated in the general venting requirements section.

1 - Seal any unused openings in the common venting system.

2 - Inspect the venting system for proper size and horizontal pitch. Determine that there is no blockage, restriction, leakage, corrosion, or other deficiencies which could cause an unsafe condition.

3 - Close all building doors and windows and all doors between the space in which the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any appliances not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.

4 - Follow the lighting instructions. Turn on the appliance that is being inspected. Adjust the thermostat so that the appliance operates continuously.

5 - After the main burner has operated for 5 minutes, test for leaks of flue gases at the draft hood relief opening. Use the flame of a match or candle.

6 - After determining that each appliance connected to the common venting system is venting properly, (step 3) return all doors, widows, exhaust fans, fireplace dampers, and any other gas-burning appliances to their previous mode of operation.

7 - If a venting problem is found during any of the preceding tests, the common venting system must be modified to correct the problem.

Resize the common venting system to the minimum vent pipe size determined by using the appropriate tables in Appendix G. (These are in the current standards of the National Fuel Gas Code ANSI Z223.1.

</table>

**NOTE** - Capacity given in cubic feet (m3) of gas per hour and based on 0.60 specific gravity gas.
Electrostatic discharge can affect electronic components. Take precautions during furnace installation and service to protect the furnace’s electronic controls. Precautions will help to avoid control exposure to electrostatic discharge by putting the furnace, the control and the technician at the same electrostatic potential. Neutralize electrostatic charge by touching hand and all tools on an unpainted unit surface, such as the gas valve or blower deck, before performing any service procedure.

WARNING
Electric Shock Hazard. Can cause injury or death. Unit must be properly grounded in accordance with national and local codes.

WARNING
Fire Hazard. Use of aluminum wire with this product may result in a fire, causing property damage, severe injury or death. Use copper wire only with this product.

CAUTION
Failure to use properly sized wiring and circuit breaker may result in property damage. Size wiring and circuit breaker(s) per Product Specifications bulletin (EHB) and unit rating plate.

INTERIOR MAKE-UP BOX INSTALLATION

FIGURE 51

The unit is equipped with a field make-up box on the left hand side of the cabinet. The make-up box may be moved to the right side of the furnace to facilitate installation. If the make-up box is moved to the right side, clip the wire ties that bundle the wires together. The excess wire must be pulled into the blower compartment. Secure the excess wire to the existing harness to protect it from damage.

See FIGURE 52 and FIGURE 53 for thermostat wiring in communicating applications. TABLE 15 shows DIP switch and on-board link settings for non-communicating thermostat applications. Typical wiring schematic is shown in FIGURE 54.

1 - The power supply wiring must meet Class I restrictions. Protected by either a fuse or circuit breaker, select circuit protection and wire size according to unit nameplate.

NOTE - Unit nameplate states maximum current draw. See TABLE 12 for maximum over-current protection.

<table>
<thead>
<tr>
<th>SL99UHV Model</th>
<th>Maximum Over-Current Protection Amps</th>
</tr>
</thead>
<tbody>
<tr>
<td>070-36B, 090-36C, 090-48C</td>
<td>15</td>
</tr>
<tr>
<td>090-60C, 110-60C, 135-60D</td>
<td>20</td>
</tr>
</tbody>
</table>

2 - Holes are on both sides of the furnace cabinet to facilitate wiring.

3 - Install a separate (properly sized) disconnect switch near the furnace so that power can be turned off for servicing.

4 - Before connecting the thermostat or the power wiring, check to make sure the wires will be long enough for servicing at a later date. Remove the blower access panel to check the length of the wire.

5 - Complete the wiring connections to the equipment. Use the provided unit wiring and field wiring diagram shown in FIGURE 54 and TABLE 15. Use 18-gauge wire or larger that is suitable for Class II rating for thermostat connections.

NOTE - Do NOT make a wire connection between the room thermostat L terminal and the L terminal of the SLP99UHV integrated control unless this is a communicating thermostat installation with a non-communicating outdoor unit.

6 - Electrically ground the unit according to local codes or, in the absence of local codes, according to the current National Electric Code (ANSI/NFPA No. 70) for the USA and current Canadian Electric Code part 1 (CSA standard C22.1) for Canada. A green ground wire is provided in the field make-up box.

7 - One line voltage “EAC” 1/4” spade terminal is provided on the furnace integrated control. Any electronic air cleaner or other 120V accessory rated up to one amp can be connected to this terminal with the neutral leg.
of the circuit being connected to one of the provided neutral terminals. See FIGURE 55 for location of terminal. This terminal is energized when the indoor blower is operating.

8 - One line voltage “HUM” 1/4” spade terminal is provided on the furnace integrated control. Any humidifier or other 120V accessory rated up to one amp can be connected to this terminal with the neutral leg of the circuit being connected to one of the provided neutral terminals. See FIGURE 55 for location of terminal. This terminal is energized in the heating mode when the indoor blower is operating.

9 - One 24V “H” terminal is provided on the furnace integrated control terminal block. Any humidifier rated up to 0.5 amp can be connected to this terminal with the ground leg of the circuit being connected to either ground or the “C” terminal. See FIGURE 55 for location of terminal.

10 - Install the room thermostat according to the instructions provided with the thermostat. See TABLE 15 for thermostat connections. If the furnace is being matched with a heat pump, refer to the instructions packaged with the dual fuel thermostat.

NOTE - The discharge air temperature sensor is intended to be mounted downstream of the heat exchanger and air conditioning coil. It must be placed in free airflow, where other accessories (humidifiers, UV lights etc.) will not interfere with its accuracy. Wiring distance between the furnace and discharge air sensor should not exceed 10 ft. when wired with 18-gauge thermostat wire.

### Thermostat Selection

The SLP99UHV is designed to operate in a variable rate capacity mode using a two-stage thermostat. The SLP99UHV will automatically adjust firing rate based upon thermostat cycle times.

A communicating thermostat must be used in communicating applications. Refer to the instructions provided with the thermostat for installation, set-up and operation.

For optimal performance in non-communicating applications, Lennox recommends use of a ComfortSense® 7500 high quality electronic digital thermostat or any other with adjustable settings for 1st stage / 2nd stage on / off differentials and adjustable stage timers.

Lennox recommends the following two-stage thermostat set-up for optimal variable rate capacity mode: First heat stage differential set to 1/2 to 1 degree F; second heat stage differential set to 1/2 or 1 degree F; second heat stage upstage timer disabled, or set to maximum (1 hr minimum).

### Indoor Blower Speeds

NOTE - When the SLP99UHV is used with a communicating thermostat, proper indoor blower speed selections are made by the thermostat.

1 - When the thermostat is set to “FAN ON,” the indoor blower will run continuously at a percentage of the second- stage cooling speed when there is no cooling or heating demand. The percentage is set using DIP switches 6 and 7. See TABLE 25 on page 49 for allowable circulation speeds.

2 - When the SLP99UHV is running in the heating mode, the integrated control will automatically adjust the blower speed to match the furnace firing rate. This speed can be adjusted up or down by 7.5% or 15% using DIP switches 14 through 16 for the low heat speed and 17 through 19 for the high heat speed. See TABLE 24 on page 49 for allowable heating speeds.

3 - When there is a cooling demand, the indoor blower will run on the cooling speed designated by the positions of DIP switches 8 through 11.

### Generator Use - Voltage Requirements

The following requirements must be kept in mind when specifying a generator for use with this equipment:

- The furnace requires 120 volts + 10% (Range: 108 volts to 132 volts).
- The furnace operates at 60 Hz + 5% (Range: 57 Hz to 63 Hz).
- The furnace integrated control requires both polarity and proper ground. Both polarity and proper grounding should be checked before attempting to operate the furnace on either permanent or temporary power.
- Generator should have a wave form distortion of less than 5% THD (total harmonic distortion).
Communicating systems using the communicating thermostat require four thermostat wires between the thermostat and the furnace/air handler control and four wires between the outdoor unit and the furnace/air handler control. When a thermostat cable with more than four wires is used, the extra wires must be properly connected to avoid electrical noise. The wires must not be left disconnected.

Use wire nuts to bundle the four unused wires at each end of the cable. A single wire should then be connected to the indoor unit end of the wire bundle and attached to the “C” terminals as shown in the diagram above.

**FIGURE 52**
Optional Accessories for use with Communicating System

NOTE: 24V UV LIGHT APPLICATIONS
Furnace transformer will not have adequate va to power 24v UV light applications. An additional transformer for UV light applications is required.

COMMUNICATING THERMOSTAT

DISCHARGE AIR SENSOR

NOTE: COMMUNICATING THERMOSTAT SENSES HUMIDITY & CONTROLS 24V "H" OUTPUT (& 120V "H" OUTPUT) TO CYCLE HUMIDIFIER BASED ON DEMAND. NO OTHER CONTROL OR HUMIDISTAT REQUIRED.

**NOTE** - When the SLP99UHV is used with a communicating thermostat, all indoor blower speed selections and DIP switch settings are made by the thermostat.

SLP99UHV units are equipped with an integrated control. This control manages ignition timing, combustion air inducer speed, heating mode fan off delays and indoor blower speeds based on selections made using a communicating thermostat or the control DIP switches and on-board links. The control includes an internal Watchguard feature which automatically resets the ignition control when it has been locked out.

**NOTE** - All DIP switches are factory shipped in the “OFF” position.

Heating Operation DIP Switch Settings -- FIGURE 55

Switch 1 -- Thermostat Selection -- This unit may be used with either a single-stage or two-stage thermostat. The thermostat selection is made using a DIP switch which must be properly positioned for the particular application. The DIP switch is factory-positioned for use with a twostage thermostat. If a single-stage thermostat is to be used, the DIP switch must be repositioned. See TABLE 16.

Switch 2 -- Operating Mode with Two-Stage Thermostat -- If a two-stage thermostat is used, the furnace can operate in either variable-capacity or conventional twostage mode. When variable-capacity mode is selected, the firing rate of the unit is varied to maximize comfort. Conventional two-stage mode is the factory default setting. See TABLE 16.

Switch 3 -- Second-Stage Heat On Delay -- If a single-stage thermostat is used, the integrated control can be used to energize second-stage heat after either 7 minutes or 12 minutes of first-stage heat operation. See TABLE 16.

Switches 4 and 5 -- Blower-Off Delay -- The blower-on delay of 30 seconds is not adjustable. The blower-off delay (time that the blower operates after the heating demand has been satisfied) can be adjusted by moving switches 4 and 5 on the integrated control. The unit is shipped from the factory with a blower-off delay of 120 seconds. The blower off delay affects comfort and is adjustable to satisfy individual applications. Adjust the blower off delay to achieve a supply air temperature between 90°F and 110°F at the exact moment that the blower is de-energized. Longer off delay settings provide lower supply air temperatures; shorter settings provide higher supply air temperatures. TABLE 17 provides the blower-off timings that will result from different switch settings.

**NOTE** - When the SLP99UHV is used with a communicating thermostat, all indoor blower speed selections and DIP switch settings are made by the thermostat.

SLP99UHV units are equipped with an integrated control. This control manages ignition timing, combustion air inducer speed, heating mode fan off delays and indoor blower speeds based on selections made using a communicating thermostat or the control DIP switches and on-board links. The control includes an internal Watchguard feature which automatically resets the ignition control when it has been locked out.

**NOTE** - All DIP switches are factory shipped in the “OFF” position.

Heating Operation DIP Switch Settings -- FIGURE 55

Switches 10 and 11 - Cooling Mode Blower Speed Adjustment

The unit is shipped from the factory with the DIP switches positioned for NORMAL (no) adjustment. The DIP switches may be positioned to adjust the blower speed by +10% or -10% to better suit the application. Table 17 provides blower speed adjustments that will result from different switch settings. Refer to tables beginning on page 44 for corresponding cfm values.

With switches 10 and 11 set to ON, motor will bypass ramping profiles and all delays and will immediately run at selected COOLING speed upon a call for cool. LED will continue to operate as normal. This mode is used to check motor operation.

Switches 12 and 13 - Cooling Mode Blower Speed Ramping

Blower speed ramping may be used to enhance dehumidification performance. The switches are factory set at option A which has the greatest effect on blower motor performance. TABLE 21 provides the cooling mode blower speed ramping options that will result from different switch settings. The cooling mode blower speed ramping options are detailed below.

NOTE - The off portion of the selected ramp profile only applies during heat pump operation in dual fuel applications.

<table>

</tr>
</tbody>
</table>

Ramping Option A (Factory Selection)

- Motor runs at 50% for 30 seconds.
- Motor then runs at 82% for approximately 7-1/2 minutes.
- If demand has not been satisfied after 7-1/2 minutes, motor runs at 100% until demand is satisfied.
- Once demand is met, motor runs at 50% for 30 seconds then ramps down to stop.

Ramping Option B

- Motor runs at 82% for approximately 7-1/2 minutes. If demand has not been satisfied after 7-1/2 minutes, motor runs at 100% until demand is satisfied.
- Once demand is met, motor ramps down to stop.

Ramping Option C

- Motor runs at 100% until demand is satisfied.
- Once demand is met, motor runs at 100% for 45 seconds then ramps down to stop.

Ramping Option D

- Motor runs at 100% until demand is satisfied.
- Once demand is met, motor ramps down to stop.
Switches 14 through 19 -- Heating Mode Blower Speed

These switches are factory set at the OFF position which provides 100% of normal speed during HIGH HEAT demand, 70% of normal speed during MID-RANGE HEAT demand and 35% of normal speed during LOW HEAT demand. Switches 14, 15 and 16 are used to adjust the LOW HEAT blower motor speed. Switches 17, 18 and 19 are used to adjust the HIGH HEAT blower motor speed. TABLE 22 provides the heating mode blower speeds that will result from different switch settings. Refer to tables beginning on page 42 for corresponding cfm values. See TABLE 24 on page 49 for allowable heating speeds.

On-Board Links

On-board link W915 Y1 to Y2 (FIGURE 55)

On-board link W915 is a clippable connection between terminals Y1 and Y2 on the integrated control. W915 must be cut if two-stage cooling will be used. If the link is not cut the outdoor unit will operate in second-stage cooling only.

Diagnostic LED (FIGURE 55)

The seven-segment diagnostic LED displays operating status, target airflow, error codes and other information. The table beginning on Page 56 lists diagnostic LED codes.

Diagnostic Push Button (FIGURE 55)

The diagnostic push button is located adjacent to the seven-segment diagnostic LED. This button is used to enable the Error Code Recall mode and the Field Test mode. Press the button and hold it to cycle through a menu of options. Every five seconds a new menu item will be displayed. When the button is released, the displayed item will be selected. Once all items in the menu have been displayed, the menu resumes from the beginning until the button is released.

Error Code Recall Mode

Select “E” from the menu to access the most recent 10 error codes. Select “c” from the Error Code Recall menu to clear all error codes. Button must be pressed a second time while “c” is flashing to confirm command to delete codes. Press the button until a solid “≡” is displayed to exit the Error Code Recall mode.

Field Test Mode

Use the diagnostic push button to scroll through the menu as described above. Release the button when the LED flashes “-” to select the Field Test mode.

While in the Field Test mode the technician can:

- Initiate furnace ignition and move to and hold low-fire rate by applying a R to W1 jumper.
- Initiate furnace ignition sequence and move to and hold high-fire rate by applying a jumper from R to W1 and W2.
- Initiate furnace ignition sequence and move to and hold mid-fire rate by applying a jumper to R and W2.
- Apply then remove the jumper from R to W1 and W2 to change the firing rate from low fire to mid fire and high fire.
- A vent calibration sequence can be initiated even if a thermostat signal is not present. Press and hold the push button until a solid “C” is displayed. Release the button and calibration will begin. The furnace will perform the high-fire and low-fire pressure switch calibrations and display “CAL”. After calibration, the LED will return to the flashing “-” display.

During Field Test mode operation, all safety switches are still in the circuit (they are not by-passed) and indoor blower performance and timings will match DIP switch selections. Current furnace firing rate, indoor blower CFM and flame signal will be displayed. To exit the Field Test mode, press and hold the button. The menu will resume from the beginning. Also, cycle the main power to exit the Field Test mode. The integrated control will automatically exit the Field Test mode after 45 minutes of operation.

On-Board Link W914 DS to R (FIGURE 55)

On-board link W914, is a clippable connection between terminals DS and R on the integrated control. W914 must be cut when the furnace is installed with either the Harmony III zone control or a thermostat which features humidity control. If the link is left intact the PMW signal from the Harmony III control will be blocked and also lead to control damage. See TABLE 26 on page 49 for operation sequence in applications including SLP99UHV, a thermostat which features humidity control and a single-speed outdoor unit. TABLE 27 gives the operation sequence in applications with a two-speed outdoor unit.

On-Board Link W951 R to O (FIGURE 55)

On-board link W951 is a clippable connection between terminals R and O on the integrated control. W951 must be cut when the furnace is installed in applications which include a heat pump unit and a thermostat which features dual fuel use. If the link is left intact, terminal “O” will remain energized eliminating the HEAT MODE in the heat pump.

The effect of static pressure is included in air volumes shown.

The following control configurations are available. See Installation Instructions for details and DIP switch settings.

**Heat Modes Available (Heating Blower Performance Table):**

- Single stage thermostat:
  - 35%, 70%, 100% input (three-stage) with time delays in-between.
- Two-stage thermostat:
  - Variable Rate Capacity Mode - furnace automatically adjusts firing rate based on first- and second-stage cycle times.
  - W1 demand at 70% input, W2 demand at 100% input. No delay between stages.

**Cool Mode Available (Cooling Blower Performance Table):**

First stage COOL (two-stage air conditioning units only) is approximately 70% of the same second stage COOL speed position. Continuous Fan speeds are approximately 28% and 38% (DIP switch selectable) of the same second-stage COOL speed position. Minimum 250 cfm.

Lennox iHarmony® Zoning System Applications - Minimum blower speed is 250 cfm.

- With Heat Pump - Cut W914 (R to DS) & W951 (R to O) on SureLight® integrated control.

*ComfortSense® 7500 thermostat only*
**Unit Start-Up**

**FOR YOUR SAFETY READ BEFORE OPERATING**

**WARNING**
Do not use this furnace if any part has been underwater. A flood-damaged furnace is extremely dangerous. Attempts to use the furnace can result in fire or explosion. Immediately call a qualified service technician to inspect the furnace and to replace all gas controls, control system parts, and electrical parts that have been wet or to replace the furnace, if deemed necessary.

**WARNING**
Danger of explosion. Can cause injury or product or property damage. Should the gas supply fail to shut off or if overheating occurs, shut off the gas valve to the furnace before shutting off the electrical supply.

**CAUTION**
Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch.

**WARNING**
During blower operation, the ECM motor emits energy that may interfere with pacemaker operation. Interference is reduced by both the sheet metal cabinet and distance.

**Priming Condensate Trap**
The condensate trap should be primed with water prior to start-up to ensure proper condensate drainage. Either pour 10 fl. oz. (300 ml) of water into the trap, or follow these steps to prime the trap:

1. Follow the lighting instructions to place the unit into operation.
2. Set the thermostat to initiate a heating demand.
3. Allow the burners to fire for approximately 3 minutes.
4. Adjust the thermostat to deactivate the heating demand.
5. Wait for the combustion air inducer to stop. Set the thermostat to initiate a heating demand and again allow the burners to fire for approximately 3 minutes.
6. Adjust the thermostat to deactivate the heating demand and again wait for the combustion air inducer to stop. At this point, the trap should be primed with sufficient water to ensure proper condensate drain operation.

**BEFORE PLACING THE UNIT INTO OPERATION,** smell all around the furnace area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor. The gas valve on the SLP99UHV is equipped with a gas control switch. Use only your hand to move the control switch. Never use tools. If the switch will not move by hand, do not try to repair it. Force or attempted repair may result in a fire or explosion.

**Placing the furnace into operation:**

SLP99UHV units are equipped with an automatic ignition system. Do not attempt to manually light burners on this furnace. Each time the thermostat calls for heat, the burners will automatically light. The ignitor does not get hot when there is no call for heat on units with this ignition system.

**WARNING**
If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or death.

**Gas Valve Operation (FIGURE 56)**

1. **STOP!** Read the safety information at the beginning of this section.
2. Set the thermostat to the lowest setting.
3. Turn off all electrical power to the unit.
4. This furnace is equipped with an ignition device which automatically lights the burners. Do not try to light the burners by hand.
5. Remove the access panel.
6. Move the gas valve switch to the OFF position. See FIGURE 56.
7. Wait five minutes to clear out any gas. If you then smell gas, **STOP!** Immediately call the gas supplier from a neighbor's phone. Follow the gas supplier's instructions. If you do not smell gas go to next step.
8. Move gas valve switch to the ON position. See FIGURE 56. Do not force.
9. Replace the access panel.
10. Turn on all electrical power to the unit.
11. Set the thermostat to desired setting.

**NOTE** - When unit is initially started, steps 1 through 11 may need to be repeated to purge air from gas line.

12. If the appliance will not operate, follow the instructions “Turning Off Gas to Unit” and call the gas supplier.

### Turning Off Gas to Unit

1. Set the thermostat to the lowest setting.
2. Turn off all electrical power to the unit if service is to be performed.
3. Remove the access panel.
4. Move the gas valve switch to the OFF position.
5. Replace the access panel.

### Failure To Operate

If the unit fails to operate, check the following:

1. Is the thermostat calling for heat?
2. Are access panels securely in place?
3. Is the main disconnect switch closed?
4. Is there a blown fuse?
5. Is the filter dirty or plugged? Dirty or plugged filters will cause the limit control to shut the unit off.
6. Is gas turned on at the meter?
7. Is the manual main shut-off valve open?
8. Is the gas valve turned on?
9. Is the unit ignition system in lock out? If the unit locks out again, inspect the unit for blockages.
10. Is blower harness connected to ignition control? Furnace will not operate unless harness is connected.

### Gas Pressure Measurement

**Gas Flow (Approximate)**

<table>
<thead>
<tr>
<th>TABLE 28</th>
<th>GAS METER CLOCKING CHART</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLP99 Unit</td>
<td>Seconds for One Revolution</td>
</tr>
<tr>
<td></td>
<td>Natural</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td>-070</td>
<td>55</td>
</tr>
<tr>
<td>-090</td>
<td>41</td>
</tr>
<tr>
<td>-110</td>
<td>33</td>
</tr>
<tr>
<td>-135</td>
<td>27</td>
</tr>
</tbody>
</table>

Natural-1000 btu/cu ft LP-2500 btu/cu ft

Furnace should operate at least 5 minutes before checking gas flow. Determine time in seconds for two revolutions of gas through the meter. (Two revolutions assures a more accurate time.) Divide by two and compare to time in TABLE 28. If manifold pressure matches TABLE 29 and rate is incorrect, check gas orifices for proper size and restriction. Remove temporary gas meter if installed.

**NOTE** - To obtain accurate reading, shut off all other gas appliances connected to meter.

### Supply Pressure Measurement

A threaded plug on the inlet side of the gas valve provides access to the supply pressure tap. Remove the threaded plug, install a field-provided barbed fitting and connect a manometer to measure supply pressure. Replace the threaded plug after measurements have been taken.

### Manifold Pressure Measurement (FIGURE 57)

To correctly measure manifold pressure, the differential pressure between the positive gas manifold and the negative burner box must be considered. Use pressure test adapter kit (available as Lennox part 10L34) to assist in measurement.

1. Remove the threaded plug from the outlet side of the gas valve and install a field-provided barbed fitting. Connect measuring device “+” connection to barbed fitting to measure manifold pressure.
2. Tee into the gas valve regulator vent hose and connect measuring device “-” connection.
3. Start unit on low heat (35% rate) and allow 5 minutes for unit to reach steady state.
4. While waiting for the unit to stabilize, notice the flame. Flame should be stable and should not lift from burner. Natural gas should burn blue.
5. After allowing unit to stabilize for 5 minutes, record manifold pressure and compare to value given in TABLE 29.
6. Repeat steps 3, 4 and 5 on high heat.
7. Shut unit off and remove manometer as soon as an accurate reading has been obtained. Take care to remove barbed fitting and replace threaded plug.
8. Start unit and perform leak check. Seal leaks if found.

### CAUTION

Do not attempt to make adjustments to the gas valve.

### Operating Pressure Signal (Delta P) Measurement (FIGURE 58)

Operating pressure signal can be taken while the manifold pressure check is taken (using two measuring devices). Or, taken after the manifold pressure measurement is complete.

1. Tee into the negative line between the gas valve and pressure switch and connect to measuring device negative “-”.
2. Tee into the positive line between the gas valve and pressure switch and connect to measuring device positive “+”.
3. Start unit on low heat (35% rate) and allow 5 minutes for unit to reach steady state.
4. After allowing unit to stabilize for 5 minutes, record operating pressure signal and compare to value given in TABLE 29. Repeat steps 3 on 4 high heat.
MANIFOLD PRESSURE MEASUREMENT

**NOTE** - A natural to LP/propane gas changeover kit is necessary to convert this unit. Refer to the changeover kit installation instruction for the conversion procedure.

**Proper Combustion**
Furnace should operate a minimum of 15 minutes with correct manifold pressure and gas flow rate before checking combustion. Take combustion sample beyond the flue outlet and compare to the tables below. The maximum carbon monoxide reading should not exceed 100 ppm.

**High Altitude Information**

**NOTE** - In Canada, certification for installations at elevations over 4500 feet (1372 m) is the jurisdiction of local authorities. SLP99UHV units require no manifold pressure adjustments for operation at altitudes up to 10,000 feet (3048 m) above sea level. Units installed at altitude of 7,501 to 10,000 feet (2287 to 3048m) require a pressure switch change and conversion kit. See TABLE 32.

The combustion air pressure switch is factory-set and requires no adjustment.

**Other Unit Adjustments**

**Primary Limit**
The primary limit is located on the heating compartment vestibule panel. This limit is factory set and require no adjustment.

**Flame Rollout Switches (Two)**
These manually reset switches are located on the inside of the burner box. If tripped, check for adequate combustion air before resetting.
Pressure Switches (Two)
The pressure switches are located on the cold end header box. These switches check for proper combustion air in-ducer operation before allowing ignition trial. The switch-es are factory-set and require no adjustment. Pressure switch tubing installation is critical for safe operation. See FIGURE 59.

PRESSURE SWITCH TUBING INSTALLATION (shown in upflow position)

1 - Black tubing from front port on low-fire pressure switch to positive port on the gas valve.
2 - Red and black tubing from rear port on low-fire pressure switch to the negative port on the gas valve.
3 - Red and black tubing from front port on high-fire pressure switch to negative port on cold end header box.
4 - Black tubing from rear port on high-fire pressure switch to positive port on cold end header box.

FIGURE 59

Electronic Ignition
The integrated control has an added feature of an inter-nal Watchguard control. The feature serves as an auto-matic reset device for ignition control lockout caused by ignition failure. This type of lockout is usually due to low gas line pressure. After one hour of continuous thermostat demand for heat, the Watchguard will break and remake thermostat demand to the furnace and automatically reset the control to begin the ignition sequence.

Exhaust and Air Intake Pipe

1 - Check exhaust and air intake connections for tightness and to make sure there is no blockage.
2 - Are pressure switches closed? Obstructed exhaust pipe will cause unit to shut off at pressure switches. Check termination for blockages.
3 - Reset manual flame rollout switches on burner box cover.

Heating Sequence of Operation
The integrated control initiates a pressure switch calibra-tion at the initial unit start-up on a call for heat. The ignition control will also initiate a calibration any time main power is turned off and back on and a heating demand is present. Additional calibrations may be initiated by the ser-vice technician during field test sequence. The following heating sequence of operation assumes completion of a successful calibration.

NOTE - In communicating applications, the sequence of operation is the same but all DIP switch settings are over-ridden by the thermostat.

NOTE - The thermostat selection DIP switch on the inte-grated control is factory-set in the “TWO-STAGE” position.

Applications Using a Two-Stage Thermostat

A - Heating Sequence -- Control Thermostat Selection DIP switch in “Two-Stage” Position (Factory Setting)
1 - On a call for heat, thermostat first-stage contacts close sending a signal to the integrated control. The integrated control runs a self-diagnostic program and checks high temperature limit switches for normally closed contacts and pressure switches for normally open contacts. The combustion air inducer is energized at ignition speed, which is approximately the same as the inducer speed at 70 percent firing rate.
2 - Once the control receives a signal that the low-fire pressure switch has closed, the combustion air inducer begins a 15-second pre-purge in the ignition speed.
3 - After the pre-purge is complete, a 20-second initial ignitor warm-up period begins. The combustion air inducer continues to operate at the ignition speed.
4 - After the 20-second warm-up period has ended, the gas valve is energized and ignition occurs. At the same time, the control module sends a signal to begin an indoor blower 30-second ON-delay. When the delay ends, the indoor blower motor is energized at a speed that matches the firing rate. After the 10-second ignition stabilization delay expires, the

Temperature Rise
After the furnace has been started and supply and return air temperatures have been allowed to stabilize, check the temperature rise with the unit operating at 100 percent firing rate. See “Duct System” on page 10 for in-stalling the optional discharge air sensor (shipped with the furnace) used to measure temperature rise. If necessary, adjust the blower speed to maintain the temperature rise within the range shown on the unit nameplate. See TABLE 24 on page 49 for allowable heating speeds. Increase the blower speed to decrease the temperature. Decrease the blower speed to increase the temperature rise. Failure to adjust the temperature rise may cause erratic limit op-eration.
DIP switch in “Variable Capacity” Position

1 - On a call for heat, thermostat first-stage contacts close sending a signal to the integrated control. The integrated control runs a self-diagnostic program and checks high temperature limit switches for normally closed contacts and pressure switches for normally open contacts. The combustion air inducer is energized at ignition speed, which is approximately the same as the inducer speed at 70 percent firing rate.

2 - Once the control receives a signal that the low-fire pressure switch has closed, the combustion air inducer begins a 15-second pre-purge in low speed.

3 - After the pre-purge is complete, a 20-second initial ignitor warm-up period begins. The combustion air inducer continues to operate at the ignition speed.

4 - After the 20-second warm-up period has ended, the gas valve is energized and ignition occurs. At the same time, the control module begins an indoor blower 30-second ON-delay. When the delay ends, the indoor blower motor is energized at a speed that matches the firing rate. After the 10-second ignition stabilization delay expires, the inducer speed is adjusted to the appropriate target rate. If the furnace is operating in the initial heating cycle after power-up, the initial firing rate will be approximately 35 percent. The firing rate on subsequent cycles will be automatically adjusted by the integrated control based on thermostat cycles. The firing rate will vary and will range from 35 percent to 90 percent. The furnace will continue this operation as long as the thermostat has a first-stage heating demand.

5 - If second-stage heat is required, the thermostat second-stage heat contacts close and send a signal to the integrated control. The integrated control either increases the firing rate to 70 percent (if the current rate is at or below 60 percent) or increases the firing rate by 10 percent (if the current rate is above 60 percent). If the call for heat continues 5 minutes beyond this initial upstage, the rate will be increased by 10 percent every 5 minutes until the call for heat is satisfied or the furnace reaches 100 percent rate. As the firing rate increases, the indoor blower motor is adjusted to a speed which is appropriate for the target rate.

6 - At the end of the recognition delay and on all subsequent calls for heat in the same heating cycle, the integrated control energizes the combustion air inducer at high speed. The control also checks the high-pressure switch to make sure it is closed. As the inducer speed is increased to high, the indoor blower motor is adjusted to a speed which is appropriate for the target rate.

7 - When the demand for high-fire (second stage) heat is satisfied, the gas valve is de-energized and the field selected indoor blower off delay begins. The combustion air inducer begins a 20-second post-purge period.

8 - When the combustion air post-purge period is complete, the inducer is de-energized. The indoor blower is de-energized at the end of the off delay.

Applications Using a Two-Stage Thermostat

B - Heating Sequence -- Control Thermostat Selection

DIP switch in “Single-Stage” Position

1 - On a call for heat, thermostat first-stage contacts close sending a signal to the integrated control. The integrated control runs a self-diagnostic program and checks high temperature limit switches for normally closed contacts and pressure switches for normally open contacts. The combustion air inducer is energized at ignition speed, which is approximately the same as the inducer speed at 70 percent firing rate.

2 - Once the control receives a signal that the low-fire pressure switch has closed, the combustion air inducer begins a 15-second pre-purge in low speed.

3 - After the pre-purge is complete, a 20-second initial ignitor warm-up period begins. The combustion air inducer continues to operate at the ignition speed.

4 - After the 20-second warm-up period has ended, the gas valve is energized and ignition occurs. At the same time, the control module begins an indoor blower 30-second ON-delay. When the delay ends, the indoor blower motor is energized at a speed that matches the firing rate. After the 10-second ignition stabilization delay expires, the inducer speed is adjusted to the appropriate target rate. If the furnace is operating in the initial heating cycle after power-up, the initial firing rate will be approximately 35 percent. The firing rate on subsequent cycles will be automatically adjusted by the integrated control based on thermostat cycles. The firing rate will vary and will range from 35 percent to 90 percent. The furnace will continue this operation as long as the thermostat has a first-stage heating demand.

5 - If second-stage heat is required, the thermostat second-stage heat contacts close and send a signal to the integrated control. The integrated control either increases the firing rate to 70 percent (if the current rate is at or below 60 percent) or increases the firing rate by 10 percent (if the current rate is above 60 percent). If the call for heat continues 5 minutes beyond this initial upstage, the rate will be increased by 10 percent every 5 minutes until the call for heat is satisfied or the furnace reaches 100 percent rate. As the firing rate increases, the indoor blower motor is adjusted to a speed which is appropriate for the target rate.

6 - If second-stage heat demand is satisfied, but first stage is still present, the furnace will continue to operate at the present firing rate until the heat cycle ends.

7 - When the demand for first- and second-stage heat is satisfied, the gas valve is de-energized and the field selected indoor blower off delay begins. The combustion air inducer begins a 20-second post-purge period.

8 - When the combustion air post-purge period is complete, the inducer is de-energized. The indoor blower is de-energized at the end of the off delay.

Applications Using A Single-Stage Thermostat

C - Heating Sequence -- Control Thermostat Selection

DIP switch in “Single-Stage” Position

1 - On a call for heat, thermostat first-stage contacts close sending a signal to the integrated control. The integrated control runs a self-diagnostic program and checks high temperature limit switches for normally closed contacts and pressure switches for normally open contacts. The combustion air inducer is energized at ignition speed, which is approximately the same as the inducer speed at 70 percent firing rate.

2 - Once the control receives a signal that the low-fire pressure switch has closed, the combustion air inducer begins a 15-second pre-purge in low speed.

3 - After the pre-purge is complete, a 20-second initial ignitor warm-up period begins. The combustion air inducer continues to operate at the ignition speed.

4 - After the 20-second warm-up period has ended, the gas valve is energized and ignition occurs. At the same time, the control module begins an indoor blower 30-second ON-delay. When the delay ends, the indoor blower motor is energized at a speed that matches the firing rate. After the 10-second ignition stabilization delay expires, the inducer speed is adjusted to the appropriate target rate. If the furnace is operating in the initial heating cycle after power-up, the initial firing rate will be approximately 35 percent. The firing rate on subsequent cycles will be automatically adjusted by the integrated control based on thermostat cycles. The firing rate will vary and will range from 35 percent to 90 percent. The furnace will continue this operation as long as the thermostat has a first-stage heating demand.

5 - If second-stage heat is required, the thermostat second-stage heat contacts close and send a signal to the integrated control. The integrated control either increases the firing rate to 70 percent (if the current rate is at or below 60 percent) or increases the firing rate by 10 percent (if the current rate is above 60 percent). If the call for heat continues 5 minutes beyond this initial upstage, the rate will be increased by 10 percent every 5 minutes until the call for heat is satisfied or the furnace reaches 100 percent rate. As the firing rate increases, the indoor blower motor is adjusted to a speed which is appropriate for the target rate.
6 - If the heating demand continues beyond the third-stage on delay, the integrated control energizes the inducer at high speed. The indoor blower motor is adjusted to a speed which is appropriate for the target rate.

7 - When the thermostat heating demand is satisfied, the gas valve is de-energized and the combustion air inducer begins a 20-second post-purge. The field-selected indoor blower off delay begins.

8 - When the combustion air post-purge period is complete, the inducer is de-energized. The indoor blower is de-energized at the end of the off delay.

Service

**WARNING**

ELECTRICAL SHOCK, FIRE, OR EXPLOSION HAZARD.

Failure to follow safety warnings exactly could result in dangerous operation, serious injury, death or property damage.

Improper servicing could result in dangerous operation, serious injury, death, or property damage.

Before servicing, disconnect all electrical power to furnace.

When servicing controls, label all wires prior to disconnecting.

Take care to reconnect wires correctly.

Verify proper operation after servicing.

**WARNING**

The blower access panel must be securely in place when the blower and burners are operating. Gas fumes, which could contain carbon monoxide, can be drawn into living space resulting in personal injury or death.

Annual Furnace Maintenance

At the beginning of each heating season, and to comply with the Lennox Limited Warranty, your system should be checked as follows:

1 - Check wiring for loose connections, voltage at indoor unit and amperage of indoor motor.

2 - Check the condition of the belt and shaft bearings if applicable.

3 - Inspect all gas pipe and connections for leaks.

4 - Check the cleanliness of filters and change if necessary (monthly).

5 - Check the condition and cleanliness of burners and heat exchanger and clean if necessary.

6 - Check the cleanliness of blower assembly and clean the housing, blower wheel and blower motor if necessary.

7 - Inspect the condensate drain and trap for leaks and cracks. The drain and trap must also be cleaned and the trap must be primed with water. Inspect the rubber hoses connected to the pressure switches for cracks or loose connections, replace as necessary. Remove the rubber hoses from the cold end header box and inspect for any blockage, clean as needed. If strainers are installed in the hoses remember to remove and clean before reinstalling the hoses.

8 - Evaluate the heat exchanger integrity by inspecting the heat exchanger per the AHRI heat exchanger inspection procedure. This procedure can be viewed at www.ahrinet.org

9 - Ensure sufficient combustion air is available to the furnace. Fresh air grilles and louvers (on the unit and in the room where the furnace is installed) must be properly sized, open and unobstructed to provide combustion air.

10 - On condensing furnaces, inspect the furnace intake and exhaust pipes to make sure they are in place, structurally sound, without holes, blockage or leakage and the exhaust pipe is sloped toward the furnace. Inspect terminations to ensure they are free of obstructions and are structurally sound. Inspect the furnace return air duct connection to ensure the duct is sealed to the furnace. Check for air leaks on supply and return ducts and seal where necessary.

11 - Inspect the furnace return air duct connection to ensure the duct is sealed to the furnace. Check for air leaks on supply and return ducts and seal where necessary.

12 - Check the condition of the furnace cabinet insulation and repair if necessary.

13 - Perform a complete combustion analysis during the furnace inspection to ensure proper combustion and operation. Consult Service Literature for proper combustion values.

14 - Verify operation of CO detectors and replace batteries as required.

Perform a general system test. Turn on the furnace to check operating functions such as the start-up and shut-off operation.

1 - Check the operation of the ignition system, inspect and clean flame sensor. Check microamps before and after. Check controls and safety devices (gas valve, flame sensor, temperature limits). Consult Service Manual for proper operating range. Thermal Limits should be checked by restricting airflow and not disconnecting the indoor blower. For additional details, please see Service and Application Note H049.
2 - Verify that system total static pressure and airflow settings are within specific operating parameters.

3 - Clock gas meter to ensure that the unit is operating at the specified firing rate for each stage of operation. Check supply, manifold and signal pressures at 35, 70 and 100% capacity as outlined in the unit Service Literature. If manifold pressure adjustment is necessary, consult the Service Literature for unit specific information on adjusting gas pressure. Not all gas valves are adjustable. Verify correct temperature rise.

*NOTE* - After any heavy snow, ice or frozen fog event the furnace vent pipes may become restricted. Always check the vent system and remove any snow or ice that may be obstructing the plastic intake or exhaust pipes.

**Winterizing and Condensate Trap Care**

1 - Turn off power to the unit.
2 - Have a shallow pan ready to empty condensate water.
3 - Remove the drain plug from the condensate trap and empty water. Inspect the trap then reinstall the drain plug and refill trap with water.

**Cleaning the Burner Assembly**

1 - Turn off electrical and gas power supplies to furnace. Remove upper and lower furnace access panels.
2 - Disconnect the 2-pin plug from the gas valve.
3 - Remove the burner box cover.
4 - Disconnect the gas supply line from the gas valve. Remove gas valve/manifold assembly.
5 - Mark and disconnect sensor wire from the sensor. Disconnect wires from flame rollout switches.
6 - Remove four screws which secure burner box assembly to vest panel. Remove burner box from the unit.
7 - Use the soft brush attachment on a vacuum cleaner to gently clean the face of the burners. Visually inspect the inside of the burners and crossovers for any blockage caused by foreign matter. Remove any blockage.
8 - Reinstall the burner box assembly using the existing four screws. Make sure that the burners line up in the center of the burner ports.
9 - Reconnect the sensor wire and reconnect the 2-pin plug to the ignitor wiring harness. Reconnect wires to flame rollout switches.
10 - Reinstall the gas valve manifold assembly. Reconnect the gas supply line to the gas valve. Reinstall the burner box cover.
11 - Reconnect 2-pin plug to gas valve.
12 - Replace the blower compartment access panel.
13 - Refer to instruction on verifying gas and electrical connections when re-establishing supplies.
14 - Follow lighting instructions to light and operate furnace for 5 minutes to ensure that heat exchanger is clean and dry and that furnace is operating properly.
15 - Replace heating compartment access panel.
The following repair parts are available through Lennox dealers. When ordering parts, include the complete furnace model number listed on the nameplate -- Example: SLP99UH070XV36B. All service must be performed by a licensed professional installer (or equivalent), service agency, or gas supplier.

**Cabinet Parts**
- Outer access panel
- Blower access panel
- Top cap

**Control Panel Parts**
- Transformer
- Integrated control
- Door interlock switch
- Circuit breaker

**Blower Parts**
- Blower wheel
- Motor
- Motor mounting frame
- Blower housing cut-off plate
- Power choke (1HP only)

**Heating Parts**
- Flame sensor
- Heat exchanger assembly
- Gas manifold
- Combustion air inducer
- Gas valve
- Main burner cluster
- Main burner orifices
- Pressure switches
- Ignitor
- Primary limit control
- Flame rollout switches
## Integrated Control Diagnostic Codes

Press the diagnostic push button and hold it to cycle through a menu of options. Every five seconds a new menu item will be displayed.
Release the button when the desired mode is displayed.

When a solid “P” is displayed, the furnace capacity/ size is programmed.

When the solid “E” is displayed, the control enters the Error Code Recall mode. Error Code Recall mode menu options: No change (displaying error history) remains in Error Code Recall mode; solid “b” exits Error Code Recall mode; and solid “c” clears the error history. Must press button while flashing “c” is displayed to clear error codes.

When the solid “-” is displayed, the control enters the Field Test mode. Field Test mode menu options: Solid “C” starts pressure switch calibration; blinking “-” exits Field Test mode.

Configuring Unit Size Codes

Power-Up - Number displayed represents by integrated control unit size code (furnace model and capacity). If three horizontal bars are displayed followed by continuous E203, furnace control does not recognize unit size code. Configure per the following:

1. Furnace control in IDLE mode (No heating, cooling or indoor fan operation)
2. Turn room thermostat to OFF
3. Push and hold button until the solid P symbol is displayed on the 7-segment LED. Release button. This mode allows the user to select a unit size code number that matches the furnace model size and capacity.

IMPORTANT: Field replacement controls may need to be manually configured to validate furnace unit size code.

4. Solid P starts blinking on 7-Segment LED
5. Push and hold button until the solid P symbol is displayed on the 7-segment LED. Release button. This mode allows the user to select a unit size code number for each furnace model for five seconds.
6. Verify that the selected unit size code is correct and stored in non-volatile memory by cycling the 24 volt power to the furnace control. (At 24 volt power-up of the furnace control, the 7-segment LED will display a unit size code. If three horizontal bars display, board does not recognize unit size code. Programming function must be repeated.)

When the correct unit size code is displayed, release button. Selected code will flash for 10-second period. During that period, hold push button until code stops blinking (disappear for 2 seconds). Integrated control will store code in memory and will automatically exit Field Test Mode and reset. (If second period expires or push button is held less than five seconds, control will automatically exit Field Test Mode and go into IDLE mode without storing unit size code. If this happens, programming function must be repeated).

UNIT SIZE CODE FURNACE MODEL
A SLP99UHVX-070-36B
b SLP99UHVX-090-36C
C SLP99UHVX-090-48C
d SLP99UHVX-090-60C
E SLP99UHVX-110-60C
F SLP99UHVX-135-60C

If alarm is present, furnace control will display error code. If alarm is not present solid dash starts blinking on 7-segment LED display.

If alarm is present, furnace control will display error code. If alarm is not present solid dash starts blinking on 7-segment LED display.

FINISHED
IGNITION AND CALL FOR LOW FIRE WITH TWO-STAGE THERMOSTAT

1. Safety Check

- Verify there is no main burner flame.
  - Limit switch closed?
    - NO: De-energize gas valve.
      - Combustion air inducer on (100% rate speed)
        - Error code flashes
      - Indoor Blower ON (100%)
    - YES: Indoor Blower OFF after heat off delay (low heat speed)

2. Rollout Circuit closed?
   - NO: De-energize gas valve.
     - Indoor Blower OFF after heat off delay (high heat speed)
   - YES: Indoor Blower ON (70%)

3. Low pressure switch open?
   - NO: Error code flashes after 5 seconds
     - High pressure switch open?
       - NO: Error code flashes after 5 seconds
         - Indoor Blower OFF after heat off delay
       - YES: Hard Lockout: Error Code Flashes
   - YES: Combustion air inducer on at 70% rate speed

4. Low pressure switch closed within 150 seconds?
   - NO: Pre-purge 15 seconds
     - Indoor Blower OFF After Heat Off Delay
   - YES: Calibration Successful?
     - NO: 4 Calibrations Attempted?
       - YES: Soft Lockout: Error Code Flashes
       - NO: Wait 5 minutes
     - YES: Calibration Successful?
       - NO: Wait 5 minutes

                                                                                                                                                                            - YES: Calibration Successful?
                                                                                                                             - NO: Flame sensed within 4 seconds?
                                                                                                                             - YES: Ignitor OFF
                                                                                                                 - Ignitor ON 20 seconds
                                                                                                                   - Gas Valve energized
                                                                                                                      - Ignition Trial Begins (Ignitor ON)
                                                                                                                        - Indoor Blower delay timer started
                                                                                                                            - Flame sensed within 4 seconds?
                                                                                                                            - YES: Ignitor OFF
                                                                                                                            - NO: Gas Valve de-energized
                                                                                                                                - Ignitor OFF
                                                                                                                                    - Wait for ignition stabilization delay
                                                                                                                                  - Set target firing rate based on thermostat signals present
                                                                                                                                     - 2 or 3A
                                                                                                                                         - Call for 2nd stage heat
                                                                                                                                         - Call for heat satisfied

SOFT LOCKOUT IS RESET AUTOMATICALLY AFTER ONE HOUR WITH A CALL FOR HEAT ACTIVE, OR BY CYCLING THE CALL FOR HEAT, OR BY CYCLING POWER TO THE CONTROL.

HARD LOCKOUT IS RESET BY CYCLING POWER TO THE CONTROL.
Troubleshooting: Heating Sequence of Operation (continued)

CALL FOR HIGH FIRE WITH TWO-STAGE THERMOSTAT

2 Stage Thermostat

1st Call for High Fire?

YES

2nd Stage Recognition Delay (30 Seconds)

NO

Combustion Air Inducer ON (100% Rate Speed)

High Pressure Switch Closes Within 10 Seconds?

YES

Adjust Indoor Blower to Appropriate speed

NO

Increase Combustion Air Inducer Speed if Not at 100% Rate Speed

Error Code Flashes

Wait 5 Minutes

3A Wait for Call for Heat Satisfied

⚠️ System will always light at 70% even if 2nd stage call for heat is in place

⚠️ If the high pressure switch does not close within 5 attempts, the system will operate at low fire for the remainder of the call for heat at request
CALL FOR HIGH FIRE WITH TWO-STAGE THERMOSTAT

- 2
  - 2 Stage Thermostat
  - 1st Call for High Fire?
    - YES
      - 2nd Stage Recognition Delay (30 Seconds)
      - Combustion Air Inducer ON (100% Rate Speed)
    - NO
      - NO
        - Error Code Flashes
          - Wait 5 Minutes
      - YES
        - High Pressure Switch Closes Within 10 Seconds?
          - NO
            - Increase Combustion Air Inducer Speed if Not at 100% Rate Speed
          - YES
            - Adjust Indoor Blower to Appropriate Speed
              - 3A
                - Wait for Call for Heat Satisfied

⚠️ System will always light at 70% even if 2nd stage call for heat is in place
⚠️ If the high pressure switch does not close within 5 attempts, the system will operate at low fire for the remainder of the call for heat at request
IGNITION AND CALL FOR HEAT WITH SINGLE-STAGE THERMOSTAT

1. **Safety Check**
   - Verify There Is No Main Burner Flame

2. **Limit Switch Closed?**
   - NO: De-Energize Gas Valve
   - YES: Combustion Air Inducer ON (100%)

3. **Rollout Circuit Closed?**
   - NO: De-Energize Gas Valve
   - YES: Indoor Blower ON (70%)

4. **Low Pressure Switch Open?**
   - NO: Error Code Flashes After 5 Seconds

5. **Pressure Switch Closed Within 150 Seconds?**
   - YES: Pre-Purge 15 Seconds

6. **Ignitor ON 20 Seconds**
   - Gas Valve Energized

7. **Ignition Trial Begins Ignitor ON**
   - Indoor Blower On Delay Timer Started
   - Flame Sensed Within 4 seconds?
     - NO: Gas Valve De-energized
     - YES: Ignitor OFF

8. **Ignitor OFF**
   - Wait For Ignition Stabilization Delay
   - Move to Mid Firing Rate and High Firing Rate after 2nd and 3rd Stage Delays (based on DIP Switch selections)

9. **3B Call For Heat Satisfied**

10. **Indoor Blower OFF After Heat OFF Delay (Low Heat Speed)**
    - Limit Closes Within 3 Minutes?
      - NO: Soft Lockout: Error Code Flashes
      - YES: No

11. **Indoor Blower OFF After Heat OFF Delay (High Heat Speed)**
    - Rollout Circuit Closes?
      - NO: Soft Lockout: Error Code Flashes
      - YES: No

12. **Rollout Circuit OFF After Post-Purge**
    - Combustion Air Inducer OFF

13. **Soft Lockout: Error Code Flashes**
    - Hard Lockout: Error Code Flashes

14. **Hard Lockout: Error Code Flashes**
    - SOFT LOCKOUT IS RESET AUTOMATICALLY AFTER ONE HOUR WITH A CALL FOR HEAT ACTIVE, OR BY CYCLING THE CALL FOR HEAT, OR BY CYCLING POWER TO THE CONTROL.

15. **HARD LOCKOUT IS RESET BY CYCLING POWER TO THE CONTROL**

---

**Notes:**
- Move to Mid Firing Rate and High Firing Rate after 2nd and 3rd Stage Delays (based on DIP Switch selections).
- Indoor Blower OFF After Heat OFF Delay (Low Heat Speed)
- Indoor Blower OFF After Heat OFF Delay (High Heat Speed)
- SOFT LOCKOUT IS RESET AUTOMATICALLY AFTER ONE HOUR WITH A CALL FOR HEAT ACTIVE, OR BY CYCLING THE CALL FOR HEAT, OR BY CYCLING POWER TO THE CONTROL.
- HARD LOCKOUT IS RESET BY CYCLING POWER TO THE CONTROL.
Troubleshooting: Cooling Sequence of Operation

CALL FOR COOLING

1st Stage Cooling Request Received

Energize 1st Stage Cooling Contactor (Compressor & Fan)

Indoor Blower On After 2-second delay

Energize Indoor Blower (Per Ramping Profile)

2nd Stage Cooling Request?

YES

1st Stage Cooling Request Still Active?

YES

Energize 2nd Stage Cooling Contactor (Compressor & Fan)

Energize Indoor Blower (High Cooling mode)

NO

2nd Stage Cooling Request Still Active?

YES

Maintain Indoor Blower (High Cooling mode)

NO

De-Energize 2nd Stage Cooling Contactor (Compressor & Fan)

1st Stage Cooling Request Still Active?

YES

Energize and Maintain Indoor Blower at Low Cooling mode

NO

De-Energize 1st Stage Cooling Contactor (Compressor & Fan)

De-Energize indoor Blower Per Ramping Profile

2nd stage cooling operation requires a 2-stage thermostat, a 2-stage cooling system and on-board link W915 must be cut. The control will not respond to a 2nd stage cooling request unless a 1st stage cooling request is active.

Indoor blower cooling mode and high cooling mode have a specific ON, OFF and speed ramping profiles. The specific profile is selected using the DIP switches on the control.
CONTINUOUS LOW SPEED INDOOR BLOWER SEQUENCE OF OPERATION

1. Go to Call for Heat — Two-Stage Thermostat
2. Go to Call for Heat — Single-Stage Thermostat
3. Maintain Indoor Blower at set speed
4. Go to Call for Heat — Single-Stage Thermostat
5. Go to Call for Cooling
6. Call for Continuous Blower
   - Indoor Blower On (Speed Determined by Dip Switch settings)
   - Request for Heat Received?
     - YES: Maintain Indoor Blower at set speed
     - NO: Request for Heat Received?
       - YES: Maintain Indoor Blower at set speed
       - NO: Call for Fan Removed?
         - NO: Maintain Indoor Blower at set speed
         - YES: De-Energize Indoor Blower Per Ramping Profile

⚠️ Indoor blower low cooling mode and high cooling mode, have specific ON-OFF and speed ramping profiles. The specific profile is selected using the dip switches on the control.
Modifications to NFPA-54, Chapter 10
Revise NFPA-54 section 10.8.3 to add the following requirements:

For all side wall, horizontally vented, gas-fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet above the finished grade in the area of the venting, including but not limited to decks and porches, the following Requirements shall be satisfied:

1 - INSTALLATION OF CARBON MONOXIDE DETECTORS. At the time of installation of the side wall, horizontally vented, gas-fueled equipment, the installing plumber or gas fitter shall observe that a hard-wired carbon monoxide detector with an alarm and battery backup is installed on the floor level where the gas equipment is to be installed. In addition, the installing plumber or gas fitter shall observe that a battery-operated or hard-wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall, horizontally vented, gas-fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard-wired carbon monoxide detectors.
   a. In the event that the side wall, horizontally vented, gas-fueled equipment is installed in a crawl space or an attic, the hard-wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.
   b. In the event that the requirements of this subdivision cannot be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery-operated carbon monoxide detector with an alarm shall be installed.

2 - APPROVED CARBON MONOXIDE DETECTORS. Each carbon monoxide detector as required in accordance with the above provisions shall comply with NFPA 720 and be ANSI/UL 2034 listed and IAS certified.

3 - SIGNAGE. A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented, gas-fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (1/2) inch in size, “GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS.”

4 - INSPECTION. The state or local gas inspector of the side wall, horizontally vented, gas-fueled equipment shall not approve the installation unless, upon inspection, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CMR 5.08(2) (a) 1 through 4.

EXEMPTIONS: The following equipment is exempt from 24 CMR 5.08(2)(a) 1 through 4:

1 - The equipment listed in Chapter 10 entitled “Equipment Not Required to Be Vented” in the most current edition of NFPA 54 as adopted by the Board; and

2 - Product Approved side wall, horizontally vented, gas-fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM PROVIDED.
When the manufacturer of Product Approved side wall, horizontally vented, gas-fueled equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for installation of the equipment and the venting system shall include:

1 - Detailed instructions for the installation of the venting system design or the venting system components:
   and

2 - A complete parts list for the venting system design or venting system.

MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED.
When the manufacturer of Product Approved side wall, horizontally vented, gas-fueled equipment does not provide the parts for venting the flue gases, but identifies “special venting systems,” the following requirements shall be satisfied by the manufacturer:

1 - The referenced “special venting system” instructions shall be included with the appliance or equipment installation instructions; and

2 - The “special venting systems” shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

A copy of all installation instructions for all Product Approved side wall, horizontally vented, gas-fueled equipment, all venting instructions, all parts lists for venting instructions, and/or all venting design instructions shall remain with the appliance.
FOR THE PROVINCE OF ONTARIO, HORIZONTAL SIDEWALL VENT APPLICATIONS ONLY

For exterior horizontal venting applications, the 2” X 1.5” reducer for 2” venting at the point where the exhaust pipe exits the structure is not required in direct or nondirect vent applications in the Province of Ontario. In these applications, the vent should be oriented such that the exhaust plume is unobjectionable. If the installation requires more separation between the flue gases and the building structure, a reducer may be installed on the exhaust pipe to increase the flue gas velocity.

ADDENDUM FOR ALL PROVINCES OF CANADA

See below for venting in all provinces of Canada. Lennox approves the following termination for use in all provinces of Canada.

<table>
<thead>
<tr>
<th></th>
<th>2” (51MM) Vent Pipe</th>
<th>3” (76MM) Vent Pipe</th>

<td><strong>D</strong></td>
<td>Wall support distance from top of each pipe (intake/exhaust)</td>
<td>6” (152 mm) Max.</td>
</tr>
</tbody>
</table>

**NOTE** – Flue gas may be acidic and may adversely affect some building materials. If flue gases impinge on the building materials, a corrosion-resistant shield should be used to protect the wall surface. The shield should be constructed using wood, sheet metal or other suitable material. All seams, joints, cracks, etc. in affected area, should be sealed using an appropriate sealant.
