WARNING

Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a qualified installer or service agency.

SHIPPING AND PACKING LIST

Package 1 of 1 contains: See Illustration 1 and 2.
1 - Energy Recovery Ventilator Assembly
1 - Outdoor Fresh Air Hood with Filter
1 - Outdoor Exhaust Air Hood with Barometric Damper
1 - ERS Support Rail
1 - Adaptor Panel
1 - Balancing Damper Assembly
1 - Door Panel
1 - Hardware Bag:
14" - Gasket ¾" x 1 ¼"
7" - Gasket ¼" x ½"
1 - Field Harness
4 - Wire Ties
12 - Self-Tapping Screws 10-16 x ½"
6 - Mounting Screws 14-16 x ¾"
8 - Gold Screws 10-16 x ½"
1 - Installation Instruction

PRINCIPLE OF OPERATION

The ERS enthalpy wheel contains parallel layers of a polymeric material that are impregnated with silica gel (desiccant). The wheel is located in the entering (intake) air and exhaust air streams of the ventilation equipment. As the wheel rotates through each air stream, the wheel surface adsorbs sensible and latent energy. In the heating mode, the wheel rotates to provide a constant transfer of heat from the exhaust air stream to the colder intake air stream. During the cooling season, the process is reversed.

Illustration 1
ROOF TOP UNIT PREPARATION

1. Disconnect all power to rooftop unit.
2. Open filter access door.
3. Remove the rooftop unit horizontal return air access panels. Also remove any hoods and/or power exhaust equipment. **If economizer is installed it MUST BE removed.** Discard hoods, power exhaust equipment, and horizontal return air panels. *See Figure 1.*
4. Slide in balancing damper on economizer rails. Put balancing damper in place with the damper blade at the bottom. Balancing damper mounts in place of the economizer shown in *Figure 2.* Loosen wing nut on adjustable quadrant, rotate arm to set blades to 50% open and retighten wing nut. *See Figure 3.*
6. Using wire ties neatly route the wires to clear any moving parts.
7. Route the 3-pin connector P153 and wiring harness under the balancing damper and out the return air. Coil excess wire and route into return air of the rooftop unit. *See Figure 4.*
8. Verify the provided adaptor panel is secured to the new door panel. Also verify the platform support rail is secured to the adaptor panel. See Figure 5.

9. Install new door panel over balancing damper and secure.

INSTALL ENERGY RECOVERY SYSTEM

1. Lift ERS at least three feet (3'). Remove four screws holding telescoping leg to guide and pull out leg. Reinsert the leg from the bottom with the flat foot under the unit and reinsert one of the screws to hold leg into place. The leg will need to be adjusted later when unit is in position.

2. Apply ¾” x 1 ¼” gasket to top and bottom decks of ERS as shown in the figure. See Figure 6.

3. Position ERS in front of horizontal exhaust air opening. Line up the ERS to the rooftop unit. Ensure that there are not any screws on the rooftop unit that will interfere with the mounting flanges of the ERS and if so remove them.

   Note: Equipment support kit or equivalent should be used under feet of standoff legs to prevent roof penetration.

4. Set ERS on platform support rail slide ERS up against adaptor panel. The side flanges of adaptor panel should fit inside the posts of ERS. Secure ERS to adaptor panel using the provided 10-16 x ½” screws. See Figure 7.

5. Tuck the top flange of the ERS under the rooftop unit top panel and secure with the existing rooftop unit screws. See Figure 7.

6. Remove the screws placed in the telescoping legs and adjust the legs on the ERS until it is level. Replace all four screws in each leg to secure the ERS in the leveled position. See Figure 8.

7. Check and seal, if necessary, along the edges where the ERS meets the rooftop unit to ensure there is no air leakage. Final assembly should resemble Figure 11.

8. Remove the right front (rooftop unit side) access panel and locate the field wiring harness that was previously routed into the return air of the rooftop unit. Plug the field wiring harness into the connector located at the bottom of the access door inside the ERS. See Figure 9.

9. All electrical connections must conform to any local codes and the current National Electric Codes (NEC) and Canadian Electric Code (CEC). Refer closely to wiring diagram in unit and/or in these instructions for proper connections. Refer to the unit nameplate for the minimum circuit ampacity and maximum over current protection size. Electrical data is listed on unit rating plate and motor nameplates.

10. Connect line voltage power to ERS unit from ERS field provided or rooftop unit disconnect switch (disconnect must be properly sized). Then connect line voltage from disconnect switch through ERS knockout on back panel to control box per the wiring diagram. See Figure 10.
11. Ground unit with a suitable ground connection either through unit supply wiring or earth ground.

**Note: Unit voltage entries must be sealed weather tight after wiring is complete.**

12. Replace access panels onto the ERS unit and secure.

<table>
<thead>
<tr>
<th><strong>OPTIONAL KITS (Factory Installed)</strong></th>
</tr>
</thead>
</table>

**Motorized Intake Air Damper**

Damper mounts behind the outdoor air intake hood. It opens when the ERS is energized and closes when de-energized. Powered by B30 damper motor.

**Pressure Sensor**

Measurement device on the ERS to determine airflow across the Enthalpy Wheel.

**Low Ambient Control Kit (S26)**

Prevents frost formation on energy wheel heat transfer surfaces by terminating the intake blower operation when discharge air temperature falls below a field selectable temperature setting. Intake blower operation resumes operation after temperature rises above the adjustable temperature differential.

The frost threshold is the outdoor temperature at which frost will begin to form on the ERS wheel. For energy recovery ventilators, the frost threshold is typically below 10°F. Frost threshold is dependent on indoor temperature and humidity. The table shows how the frost threshold temperatures vary depending on indoor conditions.

<table>
<thead>
<tr>
<th>INDOOR RH AT 70°F</th>
<th>FROST THRESHOLD TEMPERATURE</th>
</tr>
</thead>
<tbody>
<tr>
<td>20%</td>
<td>0°F</td>
</tr>
<tr>
<td>30%</td>
<td>5°F</td>
</tr>
<tr>
<td>40%</td>
<td>10°F</td>
</tr>
</tbody>
</table>

Because Energy Recovery Systems have a low frost threshold, frost control options are not necessary in many climates. Where outdoor temperatures may drop below the frost threshold during the ERS operational hours, exhaust only frost control option is available.

**Stop-Start-Jog**

Control option that allows intermittent operation of the enthalpy wheel during mild outdoor conditions to provide cycling and cleaning of the wheel.

<table>
<thead>
<tr>
<th><strong>BLOWER SPEED ADJUSTMENT</strong></th>
</tr>
</thead>
</table>

Blower speed selection is accomplished by changing the speed tap wire (refer to wiring diagram) on both fresh air and exhaust air blowers. All blowers are factory set at “high” for maximum airflow. To determine air flow setting, external static pressure readings will need to be read across the ERS. Reference Table 1. For location to take pressure readings. See Figure 11.
**OPERATION**

Recovery Wheel Mode  
On a thermostat call for blower operation in heating, cooling or continuous blower, the ERS media will rotate between fresh air and exhaust air streams. Both the fresh air blower and exhaust air blower will be operating.

**SYSTEM CHECK**

1. Disconnect ERS main power.  
   **Note:** If Low ambient kit S26 is used the jumper between TB37-5 & TB37-6 should be removed. Also if system check out is being conducted at low ambient temperatures, jumper low ambient switch.

2. Open rooftop unit blower access panel and locate TB1. Jumper between “R” (24v) and “G” to energize rooftop unit blower. Refer to manufacturers instructions when an electronic thermostat or other energy management system is used.

3. Restore power to ERS unit. The recovery wheel will rotate in the air stream, fresh air dampers will open, and the blowers will operate.

4. Disconnect main power to unit before making adjustment to balancing damper and/or ERS unit.

5. Remove all jumpers and replace ERS control access cover.

6. Set thermostat to normal operating position.

7. Restore power to unit.

**MAINTENANCE**

*Motor Maintenance*  
All motors use prelubricated sealed bearings; no further lubrication is necessary.

*Mechanical Inspection*  
Make visual inspection of dampers, linkage assemblies and ERS rotating bearings during routine maintenance. Filters should be checked periodically and cleaned when necessary. Filter is located in fresh air hoods. **DO NOT** replace permanent filters with throwaway type filters.

*Energy Wheel Maintenance*  
Annual inspection of the self cleaning wheel is recommended. With power disconnected, remove ERS access panels (rear) and unplug [J150 and P150] (**Refer to wiring diagrams in this instruction manual**). Remove media and wash with water and/or mild detergent. Replace media by reversing the above procedure.

Remove jumper to install optional low ambient switch.

Lennox Rooftop Unit
Notes:
1. Remove jumper to install optional low ambient switch.
2. Step-down transformer assembly for 208-230/460/575 volt units.
3. Matching adapter harness (provided) to connect with rooftop unit. For energy management systems connect +24v to green and common 24v to black.
4. Optional low ambient switch.
5. Optional motorized intake damper.
6. Optional stop, start and jog control.
Notes:
1. Remove jumper to install field optional low ambient switch.
2. Step-down transformer assembly for 208-230/460/575 volt units.
3. Matching adapter harness (provided) to connect with rooftop unit. For energy management systems connect +24v to green and common 24v to black.
4. Optional low ambient switch.
5. Optional motorized intake damper.

INSTALLATION CHECK LIST

Model #  Serial #
Owner  Owner Phone #
Owner Address
Installing Contractor  Start Up Mechanic

☐ Inspect the unit for transit damage and report any damage on the carrier’s freight bill.
☐ Check model number to insure it matches the job requirements.
☐ Install field accessories and unit adapter panels as required. Follow accessory and unit installation manuals.
☐ Verify field wiring, including the wiring to any accessories.
☐ Check all multi-tap transformers, to insure they are set to the proper incoming voltage.
☐ Verify correct belt tension, as well as the belt/pulley alignment. Tighten if needed.
☐ Prior to energizing the unit, inspect all the electrical connections.
☐ Power the unit. Bump the motor contactor to check rotation. Three phase motors are synchronized at the factory. If blower motor fans are running backwards, de-energize power to the unit, then swap two of the three incoming electrical lines to obtain proper phasing. Re-check.
☐ Perform all start up procedures outlined in the installation manual shipped with the unit.
☐ Fill in the Start Up Information as outlined on the opposite side of this sheet.
☐ Provide owner with information packet. Explain the thermostat and unit operation.
